### 1.0 Scope

This specification documents the detail requirements for space qualified product manufactured on Analog Devices, Inc.'s QML certified line per MIL-PRF-38535 Level V except as modified herein.
The manufacturing flow described in the STANDARD SPACE LEVEL PRODUCTS PROGRAM brochure is to be considered a part of this specification. http://www.analog.com/aeroinfo
This data specifically details the space grade version of this product. A more detailed operational description and a complete data sheet for commercial product grades can be found at http://www.analog.com/ADuM7442

### 2.0 Part Number

The complete part number(s) of this specification follows:

| Specific Part Number | Description |
| :--- | :--- |
| ADuM7442R703F | 25 MBPS Quad-Channel Digital Isolator |

### 3.0 Case Outline

The case outline(s) are as designated in MIL-STD-1835 and as follows:

| Outline Letter | Descriptive Designator | $\frac{\text { Terminals }}{16 \text { lead }} \quad l$ | Lead Finish | $\frac{\text { Package style }}{\text { CDFP4-F16 Solder Dip }} \quad$ Bottom Brazed Flat Pack |
| :--- | :--- | :--- | :--- | :--- |

[^0]Information furnished by Analog Devices is believed to be accurate and reliable.

| Package: X |  |  |  |
| :---: | :---: | :---: | :---: |
| Pin Number | Terminal Symbol | Pin Type | Pin Description |
| 1 | VDD1A | Power | Supply Voltage A for Isolator Side 1.1/2 $\underline{\text { / }}$ |
| 2 | GND1 | Power | Ground 1. Ground reference for Isolator Side 1. 3/, 6/ |
| 3 | VIA | Digital Input | Logic Input A |
| 4 | VIB | Digital Input | Logic Input B |
| 5 | VOC | Digital Output | Logic Output C |
| 6 | VOD | Digital Output | Logic Output D |
| 7 | VDD1B | Power | Supply Voltage B for Isolator Side 1.1/, $\underline{\text { / }}$ |
| 8 | GND1 | Power | Ground 1. Ground reference for Isolator Side 1.3/6/ |
| 9 | GND2 | Power | Ground 2. Ground reference for Isolator Side 2.4/ |
| 10 | VDD2B | Power | Supply Voltage B for Isolator Side 2.2/L 5/ |
| 11 | VID | Digital Input | Logic Input D. |
| 12 | VIC | Digital Input | Logic Input C. |
| 13 | VOB | Digital Output | Logic Output B. |
| 14 | VOA | Digital Output | Logic Output A. |
| 15 | GND2 | Power | Ground 2. Ground reference for Isolator Side 2.4/ |
| 16 | VDD2A | Power | Supply Voltage A for Isolator Side 2. 2/, 5/ |
| Lid |  | Power | Metal Lid electrically connected to ground. (GND1) |

Figure 1 - Terminal Connections
1/ Pin 1 must be connected externally to Pin 7.
$\underline{\underline{2} /}$ Connect a ceramic bypass capacitor of value $0.01 \mu \mathrm{~F}$ to $0.1 \mu \mathrm{~F}$ between VDD1A (Pin 1) and GND1 (Pin 2), between VDD1B (Pin 7 ) and GND1 (Pin 8), between VDD2B (Pin 10) and GND2 (Pin 9), and between VDD2A (Pin 16) and GND2 (Pin 15)
3/ Pin 2 and Pin 8 are internally connected, and connecting both to GND1 is recommended.
4/ Pin 9 and Pin 15 are internally connected, and connecting both to GND2 is recommended.
5/ Pin 10 must be connected externally to Pin 16.
$\overline{6}$ / Internally connected to Metal Lid.

### 4.0 Specifications

4.1. Absolute Maximum Ratings 1/Supply voltage ( $\mathrm{V}_{\mathrm{DD} 1}, \mathrm{~V}_{\mathrm{DD} 2}$ )-0.5 V to 7.0 V
Input voltage ( $\mathrm{V}_{\mathrm{IA}}, \mathrm{V}_{\mathrm{IB}}, \mathrm{V}_{\mathrm{IC}}, \mathrm{V}_{\mathrm{ID}}$ ) ..... -0.5 V to $\mathrm{VDDI}^{+}+0.5 \mathrm{~V} \underline{2} / \underline{3} /$
Output voltage (Voa, Vob, Voc, Vod) -0.5 V to $\mathrm{V}_{\mathrm{DDO}}+0.5 \mathrm{~V} 2 / 3 /$
Storage temperature range $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Output current per pin (lo1, lo2) -10 mA to +10 mA
Junction temperature maximum ( $\mathrm{T}_{\mathrm{J}}$ ) ..... $+150^{\circ} \mathrm{C}$
Lead temperature (soldering, 60 seconds) ..... $+300^{\circ} \mathrm{C}$
Thermal resistance, junction-to-case ( $\theta \mathrm{Jc}$ ) ..... $60^{\circ} \mathrm{C} / \mathrm{W} 4 /$
Thermal resistance, junction-to-ambient ( $\theta_{\mathrm{JA}}$ ) ..... $98^{\circ} \mathrm{C} / \mathrm{W}$ 4/
4.2. Recommended Operating Conditions
Supply voltage (VDI) ..... +3.3 V to +5.0 V
Ambient operating temperature range $\left(T_{A}\right)$. ..... $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
4.3. Nominal Operating Performance Characteristics 5/
Jitter ..... 2ns
Refresh Rate$\mathrm{V}_{\mathrm{DD} 1}=\mathrm{V}_{\mathrm{DD} 2}=5 \mathrm{~V}$1.2 Mbps
$V_{D D 1}=V_{D D 2}=3.3 \mathrm{~V}$ 1.1 Mbps
$V_{D D 1}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{DD} 2}=3.3 \mathrm{~V}$ ..... 1.2 Mbps
$V_{D D 1}=3.3 \mathrm{~V}, V_{D D 2}=5.0 \mathrm{~V}$ ..... 1.1 Mbps
Common Mode Transient Immunity |CM| ..... $15 \mathrm{kV} / \mu \mathrm{s}$ 6/
Capacitance (Input-to-Output) ..... 10pF 7/
Input Capacitance ..... 6pF 8/

## Radiation Features

$$
\text { Maximum total dose available (dose rate }=50-300 \mathrm{rads}(\mathrm{Si}) / \mathrm{s}) . . .100 \mathrm{k} \text { rads(Si) }
$$

[^1]TABLE IA - ELECTRICAL PERFORMANCE CHARACTERISTICS - 5V OPERATION

| Parameter <br> See notes at end of table | Symbol | Conditions 1/ <br> Unless otherwise specified | Sub-Group | Limit Min | Limit Max | Units |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SWITCHING CHARACTERISTICS |  |  |  |  |  |  |
| Data Rate | DR | Within PWD Limit | 9,10,11 |  | 25 | Mbps |
|  |  | M, D, P, L, R | 9 |  | 25 | Mbps |

## AC CHARACTERISTICS

| Output Rise/Fall Time $\quad \underline{2} /, \underline{3} /$ | tr/tF | $10 \%$ to $90 \%$ |
| :--- | :--- | :--- |

## TABLE IA NOTES:

$1 / \mathrm{T}_{\mathrm{A}}$ nom $=25^{\circ} \mathrm{C}$, $\mathrm{T}_{\mathrm{A}} \max =125^{\circ} \mathrm{C}$, and $\mathrm{T}_{\mathrm{A}} \min =-55^{\circ} \mathrm{C}$ unless otherwise noted. Switching specifications are tested with $\mathrm{CL}=15 \mathrm{pF}$, and CMOS signal levels, unless otherwise noted. $\mathrm{V}_{\mathrm{DDx}} \mathrm{nom}=5 \mathrm{~V}, \mathrm{~V}_{\mathrm{DDx}} \max =5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{DDx}} \min =4.5 \mathrm{~V}$
$\underline{2} /$ Parameter is part of device initial characterization which is only repeated after design and process changes or with subsequent wafer lots.
3/ Parameter is not tested post irradiation
4/ tpsk is the magnitude of the worst-case difference in tPHL or tpLH that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
$\underline{5} / V_{1 x}$ refer to the voltage input signals of a given channel (A, B, C, or D).
$\overline{6}$ / lox refer to the output current of a given channel (A, B, C, or D).
7/ $V_{D D x}$ refers to the power supply on either side of a given channel (A, B, C, or D).

## TABLE IB NOTES:

1/ TA nom $=25^{\circ} \mathrm{C}$, $\mathrm{TA}_{\mathrm{A}} \max =125^{\circ} \mathrm{C}$, and $\mathrm{TA}_{\mathrm{A}} \min =-55^{\circ} \mathrm{C}$ unless otherwise noted. Switching specifications are tested with $\mathrm{CL}=15 \mathrm{pF}$, and CMOS signal levels, unless otherwise noted. $\mathrm{V}_{\mathrm{DDx}}$ nom $=3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{Dx}} \mathrm{max}=3.6 \mathrm{~V}, \mathrm{~V}_{\mathrm{DDx}} \min =3 \mathrm{~V}$
2/ Parameter is part of device initial characterization which is only repeated after design and process changes or with subsequent wafer lots.
3/ Parameter is not tested post irradiation
$\underline{4} / t_{\text {PSK }}$ is the magnitude of the worst-case difference in $t_{P H L}$ or $t_{\text {PLH }}$ that is measured between units at the same operating temperature, supply voltages, and output load within the recommended operating conditions.
5/ Vix refer to the voltage input signals of a given channel (A, B, C, or D).
6 / lox refer to the output current of a given channel ( $A, B, C$, or $D$ ).
7/ $V_{D D x}$ refers to the power supply on either side of a given channel ( $A, B, C$, or $D$ ).

### 5.0 Burn-In Life Test, and Radiation

5.1. Burn-In Test Circuit, Life Test Circuit
5.1.1. The test conditions and circuit shall be maintained by the manufacturer under document revision level control and shall be made available to the preparing or acquiring activity upon request. The test circuit shall specify the inputs, outputs, biases, and power dissipation, as applicable, in accordance with the intent specified in method 1015 test condition D of MIL -STD-883.
5.1.2.HTRB is not applicable for this drawing.
5.2. Radiation Exposure Circuit
5.2.1.The radiation exposure circuit shall be maintained by the manufacturer under document revision level control and shall be made available to the preparing and acquiring activity upon request. Total dose irradiation testing shall be performed in accordance with MIL-STD-883 method 1019, condition A.

### 6.0 MIL-PRF-38535 QMLV Exceptions

6.1. Wafer Fabrication

Wafer fabrication occurs at MIL-PRF-38535 QML Class Q certified facility.
6.2. Wafer Lot Acceptance (WLA)

Full WLA per MIL-STD-883 TM 5007 is not available for this product. SEM inspection per MIL-STD-883 TM2018 is not applicable to the ADuM7442. The wafer fabrication process is manufactured using planarized metallization.

### 7.0 Application Notes

Figure 6. Typical Supply Current per Output Channeivs. Data Rate for 5 V and 3 V Operation (NoOutput Load)

Figure 7. Typical Supply Current per Output Channel vs. Data Rate for 5 V and 3 V Operation ( 15 pF Output Load)

Figure 8. Typical ADuM7442 $V_{D 01}$ or $V_{D 02}$ Supply Current vs. Data Rate for 5 V and 3 V Operation

## PC BOARD LAYOUT

The ADuM7442 digital isolator requires no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 9). A total of four bypass capacitors should be connected between Pin 1 and Pin 2 for $V_{D D 1 A}$, between Pin 7 and Pin 8 for $V_{D D 1 B}$, between Pin 9 and Pin 10 for $V_{\text {DD2B }}$, and between Pin 15 and Pin 16 for $V_{D D 2 A}$. Supply $V_{D D 1 A}$ Pin 1 and $V_{\text {DD1B }}$ Pin 7 should be connected together and supply $V_{D D 2 B}$ Pin 10 and $V_{D D 2 A}$ Pin 16 should be connected together. The capacitor values should be between $0.01 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$. The total lead length between both ends of the capacitor and the power supply pin should not exceed 20 mm .

Figure 9. Recommended Printed Grouit Board Layout
In applications involving high common-mode transients, it is important to minimize board coupling across the isolation barrier. Furthermore, users should design the board layout so that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this can cause voltage differentials between pins exceeding the absolute maximum ratings of the device, thereby leading to latch-up or permanent damage. See the AN-1109 Application Note for board layout guidelines.

## PROPAGATION DELAY-RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The input-to-output propagation delay time for a high-to-low transition may differ from the propagation delay time of a low-to-high transition. See Figure 4.
Pulse width distortion is the maximum difference between these two propagation delay values and an indication of how accurately the timing of the input signal is preserved.
Channel-to-channel matching refers to the maximum amount the propagation delay differs between channels within a single ADuM7442 component. Propagation delay skew refers to the maximum amount the propagation delay differs between multiple ADuM7442 components operating under the same conditions.

## DC CORRECTNESS AND MAGNETIC FIELD IMMUNITY

Positive and negative logic transitions at the isolator input cause narrow ( $\sim 1 \mathrm{~ns}$ ) pulses to be sent to the decoder using the transformer. The decoder is bistable and is, therefore, either set or reset by the pulses, indicating input logic transitions. In the absence of logic transitions at the input for more than $\sim 1 \mu \mathrm{~s}$, a periodic set of refresh pulses indicative of the correct input state is sent to ensure dc correctness at the output. If the decoder receives no internal pulses of more than approximately $5 \mu \mathrm{~s}$, the input side is assumed to be unpowered or nonfunctional, in which case the isolator output is forced to a default high state by the watchdog timer circuit. The magnetic field immunity of the ADuM7442 is determined by the changing magnetic field, which induces a voltage in the transformer's receiving coil large enough to either falsely set or reset the decoder. The following analysis defines the conditions under which this can occur. The 3 V operating condition of the ADuM7442 is examined because it represents the most susceptible mode of operation. The pulses at the transformer output have an amplitude greater than 1.0 V . The decoder has a sensing threshold at about 0.5 V , thus establishing a 0.5 V margin in which induced voltages can be tolerated. The voltage induced across the receiving coil is given by

$$
V=(-d \beta / d t) \sum \pi r n 2 ; n=1,2, \ldots, N
$$

where:
$\beta$ is magnetic flux density (gauss).
rn is the radius of the $n$th turn in the receiving coil (cm).
N is the number of turns in the receiving coil.
Given the geometry of the receiving coil in the ADuM7442 and an imposed requirement that the induced voltage be, at
most, $50 \%$ of the 0.5 V margin at the decoder, a maximum allowable magnetic field at a given frequency can be calculated. The result is shown in Figure 10.

Figure 10. Maximum Allowable External Magnetic Fiux Density
For example, at a magnetic field frequency of 1 MHz , the maximum allowable magnetic field of 0.5 kgauss induces a voltage of 0.25 V at the receiving coil. This is about $50 \%$ of the sensing threshold and does not cause a faulty output transition. Similarly, if such an event occurred during a transmitted pulse (and was of the worst-case polarity), it would reduce the received pulse from $>1.0 \mathrm{~V}$ to 0.75 V , still well above the 0.5 V sensing threshold of the decoder.

The preceding magnetic flux density values correspond to specific current magnitudes at given distances from the ADuM7442 transformers. Figure 11 shows these allowable current magnitudes as a function of frequency for selected distances. As shown, the ADuM7442 is extremely immune and can be affected only by extremely large currents operated at high frequency very close to the component. For the 1 MHz example noted previously, a 1.2 kA current would have to be placed 5 mm away from the ADuM7442 to affect the operation of the component.

Figure 11. Maximum Allowabie Current for Various Current-to-ADuN77442 Spacings
Note that at combinations of strong magnetic field and high frequency, any loops formed by printed circuit board traces can induce error voltages sufficiently large enough to trigger the thresholds of succeeding circuitry. Care should be taken in the layout of such traces to avoid this possibility.

## POWER CONSUMPTION

The supply current at a given channel of the ADuM7442 isolator is a function of the supply voltage, the data rate of the channel, and the output load of the channel.
For each input channel, the supply current is given by
$I_{D D I}=\operatorname{lod}(Q)$

$$
f \leq 0.5 f_{r}
$$

$l_{D D I}=\operatorname{loDI}(D) \times\left(2 f-f_{r}\right)+\operatorname{lodi}(Q)$

$$
\mathrm{f}>0.5 \mathrm{f}_{\mathrm{r}}
$$

For each output channel, the supply current is given by

| $\operatorname{IDDO}=\operatorname{IDDO}(Q)$ | $f \leq 0.5 \mathrm{fr}$ |
| :--- | :--- |
| $\operatorname{IDDO}=\left(\operatorname{IDDO}(\mathrm{D})+(0.5 \times 10-3) \times C_{L} \times V_{D D O}\right) \times\left(2 f-\mathrm{fr}_{\mathrm{r}}\right)+\operatorname{IDDO}(Q)$ | $\mathrm{f}>0.5 \mathrm{fr}$ |

where:
$I_{\text {IDI ( }}^{(\mathrm{D})}$, IDDO (D) are the input and output dynamic supply currents per channel (mA/Mbps).
$\mathrm{C}_{\llcorner }$is the output load capacitance (pF).
$V_{D D O}$ is the output supply voltage ( V ).
f is the input logic signal frequency $(\mathrm{MHz})$; it is half the input data rate, expressed in units of Mbps.
$f_{r}$ is the input stage refresh rate (Mbps).
$\operatorname{IDDI}(Q), \operatorname{IDDO}(Q)$ are the specified input and output quiescent supply currents (mA).
To calculate the total $\mathrm{V}_{\mathrm{DD} 1}$ and $\mathrm{V}_{\mathrm{DD} 2}$ supply current, the supply currents for each input and output channel

## ADuM7442S

corresponding to $V_{D D 1}$ and $V_{D D 2}$ are calculated and totaled. Figure 5 and Figure 6 show per-channel supply currents as a function of data rate for an unloaded output condition. Figure 7 shows the per-channel supply current as a function of data rate for a 15 pF output condition. Figure 8 show the total $\mathrm{V}_{\mathrm{DD} 1}$ and $\mathrm{V}_{\mathrm{DD} 2}$ supply current as a function of data rate for the ADuM7442.
