## Manual Supplement

| Manual Title: | 5522A Service | Supplement Issue: | 3 |
| :--- | :--- | :--- | :--- |
| Print Date: | May 2012 | Issue Date: | $4 / 16$ |
| Revision/Date: |  | Page Count: | 22 |

This supplement contains information necessary to ensure the accuracy of the above manual. This manual is distributed as an electronic manual on the following CD-ROM:

| CD Title | 5522A |
| :--- | :--- |
| CD Rev. \& Date: | $1,5 / 2012$ |
| CD PN: | 3795084 |

## Change \#1, $65530,6378,368,381,421,474$

## On pages 1-8 through 1-28 replace the General Specifications with:

## General Specifications

The following tables list the 5522A specifications. All specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the 5522A has been turned off. (For example, if the 5522A has been turned off for 5 minutes, the warm-up period is 10 minutes.)
All specifications apply for the temperature and time period indicated. For temperatures outside of tcal $\pm 5^{\circ} \mathrm{C}$ (tcal is the ambient temperature when the 5522A was adjusted), the temperature coefficient as stated in the General Specifications must be applied.

The specifications also assume the Calibrator is zeroed every seven days or whenever the ambient temperature changes more than $5{ }^{\circ} \mathrm{C}$. The tightest ohms specifications are maintained with a zero cal every 12 hours within $\pm 1^{\circ} \mathrm{C}$ of use.
Also see additional specifications later in this chapter for information on extended specifications for ac voltage and current.

| Warmup Time .............................................. Twice the time since last warmed up, to a maximum of 30 minutes. |  |
| :---: | :---: |
| Settling Time ................................................. Less than 5 seconds for all functions and ranges except as noted. |  |
| Standard Interfaces ......................................... IEEE-488 (GPIB), RS-232 |  |
| Temperature |  |
| Operating ....................................................... $0^{\circ} \mathrm{C}$ to $50^{\circ} \mathrm{C}$ |  |
| Calibration (tcal)............................................... $15^{\circ} \mathrm{C}$ to $35^{\circ} \mathrm{C}$ |  |
| Storage $\qquad$ $-20^{\circ}$ to $+70^{\circ} \mathrm{C}$; The DC current ranges 0 to 1.09999 A and 1.1 A to 2.99999 A are sensitive to storage temperatures above $50^{\circ} \mathrm{C}$. If the 5522 A is stored above $50^{\circ} \mathrm{C}$ for greater than 30 minutes, these ranges must be re-calibrated. Otherwise, the 90 day and 1 year uncertainties of these ranges double. |  |
| Temperature Coefficient | Temperature coefficient for temperatures outside tcal $\pm 5^{\circ} \mathrm{C}$ is $10 \%$ of the stated specification per ${ }^{\circ} \mathrm{C}$. |
| Relative Humidity |  |
| Operating ..................................................... $<80 \%$ to $30^{\circ} \mathrm{C},<70 \%$ to $40^{\circ} \mathrm{C},<40 \%$ to $50{ }^{\circ} \mathrm{C}$ |  |
| Storage | <95\%, non-condensing. After long periods of storage at high humidity, a drying-out period (with power on) of at least one week may be required. |

## Altitude

Operating ........................................................ 0 to 3,050 m (10,000 ft)
Non-operating ..................................................... 12,200 m (40,000 ft) maximum
Safety ................................................................. IEC 61010-1: Overvoltage CAT II, Pollution Degree 2
Output Terminal Electrical Overload Protection Provides reverse-power protection, immediate output disconnection, and/or fuse
protection on the output terminals for all functions. This protection is for applied external
voltages up to $\pm 300 \mathrm{~V}$ peak. voltages up to $\pm 300 \mathrm{~V}$ peak.
Analog Low Isolation........................................... 20 V normal operation, 400 V peak transient

## Electromagnetic Compatibility (EMC)

IEC 61326-1...................................................... (Controlled EM environment); CISPR 11, Group 1, Class A
Group 1 equipment....................................... Group 1 has intentionally generated and/or use conductively coupled radio-frequency energy which is necessary for the internal functioning of the equipment itself.
Class A equipment..
Class A equipment is equipment suitable for use in all establishments other than domestic and those directly connected to a low voltage power supply network which supplies buildings used for domestic purposes. Caution - There may be potential difficulties in ensuring electromagnetic compatibility in other environments, due to conducted and radiated disturbances.
Emissions which exceed the levels required by CISPR 11 can occur when the equipment is connected to a test object.
USA (FCC) .......................................................... 47 CFR 15 subpart B, this product is considered an exempt device per clause 15.103
Korea (KCC) .................................................... Class A Equipment (Industrial Broadcasting \& Communication Equipment) This product meets requirements for industrial (Class A) electromagnetic wave equipment and the seller or user should take notice of it. This equipment is intended for use in business environments and not to be used in homes.
If used in areas with electromagnetic fields of $1 \mathrm{~V} / \mathrm{m}$ to $3 \mathrm{~V} / \mathrm{m}$ from 0.08 GHz to 1 GHz , resistance outputs have a floor adder of $0.508 \Omega$. Performance not specified above 3 $\mathrm{V} / \mathrm{m}$. This instrument may be susceptible to electro-static discharge (ESD) to the binding posts. Good static awareness practices should be followed when handling this and other pieces of electronic equipment. Additionally, this instrument may be susceptible to electrical fast transients on the mains terminals. If any disturbances in operation are observed, it is recommended that the rear-panel chassis ground terminal be connected to a known good earth ground with a low-inductance ground strap. Note that a mains power outlet, while providing a suitable ground for protection against electric shock hazard, may
not provide an adequate ground to properly drain away conducted rf disturbances and may, in fact, be the source of the disturbance. This instrument was certified for EMC performance with data I/O cables not in excess of 3 m .
Line Power $\qquad$ Line Voltage (selectable): $100 \mathrm{~V}, 120 \mathrm{~V}, 220 \mathrm{~V}, 240 \mathrm{~V}$ Line Frequency: 47 Hz to 63 Hz Line Voltage Variation: $\pm 10 \%$ about line voltage setting For optimal performance at full dual outputs (e.g. $1000 \mathrm{~V}, 20 \mathrm{~A}$ ) choose a line voltage setting that is $\pm 7.5 \%$ from nominal.
Power Consumption 600 VA
Dimensions (HxWxL)
$17.8 \mathrm{~cm} \times 43.2 \mathrm{~cm} \times 47.3 \mathrm{~cm}$ ( $7 \mathrm{in} \times 17$ in $\times 18.6 \mathrm{in}$ ) Standard rack width and rack increment, plus $1.5 \mathrm{~cm}(0.6 \mathrm{in})$ for feet on bottom of unit.
Weight (without options)
22 kg (49 lb)
Absolute Uncertainty Definition ......................... The 5522A specifications include stability, temperature coefficient, linearity, line and load regulation, and the traceability of the external standards used for calibration. You do not need to add anything to determine the total specification of the 5522A for the temperature range indicated.
Specification Confidence Level. $\qquad$ 99 \%

## Detailed Specifications

## DC Voltage

| Range | Absolute Uncertainty, tcal $\pm 5^{\circ} \mathrm{C}$ $\pm$ (ppm of output $+\mu \mathrm{V}$ ) |  | Stability | Resolution $\mu \mathrm{V}$ | Max Burden ${ }^{[1]}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 90 days | 1 year | $\begin{gathered} 24 \text { hours, } \pm 1^{\circ} \mathrm{C} \\ \pm(\mathrm{ppm} \text { of output }+\mu \mathrm{V}) \end{gathered}$ |  |  |
| 0 to 329.9999 mV | $15+1$ | $20+1$ | $3+1$ | 0.1 | $65 \Omega$ |
| 0 to 3.299999 V | $9+2$ | $11+2$ | $2+1.5$ | 1 | 10 mA |
| 0 to 32.99999 V | $10+20$ | $12+20$ | $2+15$ | 10 | 10 mA |
| 30 to 329.9999 V | $15+150$ | $18+150$ | $2.5+100$ | 100 | 5 mA |
| 100 to 1020.000 V | $15+1500$ | $18+1500$ | $3+300$ | 1000 | 5 mA |
| Auxiliary Output (dual output mode only) ${ }^{\text {[2] }}$ |  |  |  |  |  |
| 0 to 329.9999 mV | $300+350$ | $400+350$ | $30+100$ | 1 | 5 mA |
| 0.33 to 3.299999 V | $300+350$ | $400+350$ | $30+100$ | 10 | 5 mA |
| 3.3 to 7 V | $300+350$ | $400+350$ | $30+100$ | 100 | 5 mA |
| TC Simulate and Measure in Linear $10 \mu \mathrm{~V} /{ }^{\circ} \mathrm{C}$ and $1 \mathrm{mV} /{ }^{\circ} \mathrm{C}$ modes ${ }^{[3]}$ |  |  |  |  |  |
| 0 to 329.9999 mV | $40+3$ | $50+3$ | $5+2$ | 0.1 | $10 \Omega$ |
| [1] Remote sensing is not provided. Output resistance is $<5 \mathrm{~m} \Omega$ for outputs $\geq 0.33 \mathrm{~V}$. The AUX output has an output resistance of $<1 \Omega$. TC simulation has an output impedance of $10 \Omega \pm 1 \Omega$. <br> [2] Two channels of dc voltage output are provided. <br> [3] TC simulating and measuring are not specified for operation in electromagnetic fields above $0.4 \mathrm{v} / \mathrm{m}$. |  |  |  |  |  |

| Range | Noise |  |
| :---: | :---: | :---: |
|  | Bandwidth 0.1 Hz to 10 Hz p-p $\pm$ (ppm of output + floor) | Bandwidth 10 Hz to 10 kHz rms |
| 0 to 329.9999 mV | $0+1 \mu \mathrm{~V}$ | $6 \mu \mathrm{~V}$ |
| 0 to 3.299999 V | $0+10 \mu \mathrm{~V}$ | $60 \mu \mathrm{~V}$ |
| 0 to 32.99999 V | $0+100 \mu \mathrm{~V}$ | $600 \mu \mathrm{~V}$ |
| 30 to 329.9999 V | $10+1 \mathrm{mV}$ | 20 mV |
| 100 to 1020.000 V | $10+5 \mathrm{mV}$ | 20 mV |
| Auxiliary Output (dual output mode only) ${ }^{[1]}$ |  |  |
| 0 to 329.9999 mV | $0+5 \mu \mathrm{~V}$ | $20 \mu \mathrm{~V}$ |
| 0.33 to 3.299999 V | $0+20 \mu \mathrm{~V}$ | $200 \mu \mathrm{~V}$ |
| 3.3 to 7 V | $0+100 \mu \mathrm{~V}$ | $1000 \mu \mathrm{~V}$ |
| [1] Two channels of dc voltage output are provided. |  |  |

## DC Current

| Range | Absolute Uncertainty, tcal $\pm 5^{\circ} \mathrm{C}$ $\pm$ (ppm of output $+\mu \mathrm{A}$ ) |  | Resolution | Max Compliance Voltage V | Max Inductive Load mH |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 90 days | 1 year |  |  |  |
| 0 to $329.999 \mu \mathrm{~A}$ | $120+0.02$ | $150+0.02$ | 1 nA | 10 | 400 |
| 0 to 3.29999 mA | $80+0.05$ | $100+0.05$ | $0.01 \mu \mathrm{~A}$ | 10 |  |
| 0 to 32.9999 mA | $80+0.25$ | $100+0.25$ | $0.1 \mu \mathrm{~A}$ | 7 |  |
| 0 to 329.999 mA | $80+2.5$ | $100+2.5$ | $1 \mu \mathrm{~A}$ | 7 |  |
| 0 to 1.09999 A | $160+40$ | $200+40$ | $10 \mu \mathrm{~A}$ | 6 |  |
| 1.1 to 2.99999 A | $300+40$ | $380+40$ | $10 \mu \mathrm{~A}$ | 6 |  |
| 0 to 10.9999 A (20 A Range) | $380+500$ | $500+500$ | $100 \mu \mathrm{~A}$ | 4 |  |
| 11 to $20.5 \mathrm{~A}^{[1]}$ | $800+750{ }^{[2]}$ | $1000+750{ }^{[2]}$ | $100 \mu \mathrm{~A}$ | 4 |  |

[1] Duty Cycle: Currents <11 A may be provided continuously. For currents $>11 \mathrm{~A}$, see Figure 1. The current may be provided Formula $60-\mathrm{T}-\mathrm{I}$ minutes any 60 minute period where T is the temperature in ${ }^{\circ} \mathrm{C}$ (room temperature is about $23^{\circ} \mathrm{C}$ ) and I is the output current in amperes. For example, 17 A , at $23^{\circ} \mathrm{C}$ could be provided for 60-23-17 = 20 minutes each hour. When the 5522A is outputting currents between 5 and 11 amps for long periods, the internal self-heating reduces the duty cycle. Under those conditions, the allowable "on" time indicated by the formula and Figure 1 is achieved only after the 5522A is outputting currents $<5 \mathrm{~A}$ for the "off" period first.
[2] Floor specification is $1500 \mu \mathrm{~A}$ within 30 seconds of selecting operate. For operating times $>30$ seconds, the floor specification is $750 \mu \mathrm{~A}$.

| Range | Noise |  |
| :--- | :---: | :---: |
|  | Bandwidth 0.1 Hz to $\mathbf{1 0} \mathbf{~ H z ~ p - p}$ | Bandwidth $\mathbf{1 0} \mathbf{~ H z}$ to $\mathbf{1 0} \mathbf{~ k H z} \mathbf{~ r m s}$ |
| 0 to $329.999 \mu \mathrm{~A}$ | 2 nA | 20 nA |
| 0 to 3.29999 mA | 20 nA | 200 nA |
| 0 to 32.9999 mA | 200 nA | $2.0 \mu \mathrm{~A}$ |
| 0 to 329.999 mA | 2000 nA | $20 \mu \mathrm{~A}$ |

[1] Duty Cycle: Currents <11 A may be provided continuously. For currents $>11$ A, see Figure 1. The current may be provided 60-T-I minutes any 60 minute period where T is the temperature in ${ }^{\circ} \mathrm{C}$ (room temperature is about $23^{\circ} \mathrm{C}$ ) and I is the output current in Amps. For example, 17 A , at $23^{\circ} \mathrm{C}$ could be provided for $60-23-17=20$ minutes each hour. When the 5522A is outputting currents between 5 and 11 amps for long periods, the internal self-heating reduces the duty cycle. Under those conditions, the allowable "on" time indicated by the formula and Figure 1 is achieved only after the 5522A is outputting currents <5 A for the "off" period first.
[2] For compliance voltages greater than 1 V , add $1 \mathrm{~mA} / \mathrm{V}$ to the floor specification from 1 to 5 kHz .
[3] For compliance voltages greater than 1 V , add $5 \mathrm{~mA} / \mathrm{V}$ to the floor specification from 5 to 10 kHz .

[1] To determine ac power uncertainty with more precision, see the individual "AC Voltage Specifications" and "AC Current Specifications" and "Calculating Power Uncertainty."
[2] Add $0.02 \%$ unless a settling time of 30 seconds is allowed for output currents $>10 \mathrm{~A}$ or for currents on the highest two current ranges within 30 seconds of an output current $>10 \mathrm{~A}$.

## Power and Dual Output Limit Specifications

| Frequency | Voltages (NORMAL) | Currents | Voltages (AUX) | Power Factor (PF) |
| :---: | :---: | :---: | :---: | :---: |
| dc | 0 to $\pm 1020 \mathrm{~V}$ | 0 to $\pm 20.5 \mathrm{~A}$ | 0 to $\pm 7 \mathrm{~V}$ | - |
| 10 to 45 Hz | 33 mV to 32.9999 V | 3.3 mA to 2.99999 A | 10 mV to 5 V | 0 to 1 |
| 45 to 65 Hz | 33 mV to 1020 V | 3.3 mA to 20.5 A | 10 mV to 5 V | 0 to 1 |
| 65 to 500 Hz | 330 mV to 1020 V | 33 mA to 2.99999 A | 100 mV to 5 V | 0 to 1 |
| 65 to 500 Hz | 3.3 to 1020 V | 33 mA to 20.5 A | 100 mV to 5 V | 0 to 1 |
| 500 Hz to 1 kHz | 330 mV to 1020 V | 33 mA to 20.5 A | 100 mV to 5 V | 0 to 1 |
| 1 to 5 kHz | 3.3 to 500 V | 33 mA to 2.99999 A | 100 mV to 5 V | 0 to 1 |
| 5 to 10 kHz | 3.3 to 250 V | 33 to 329.99 mA | 1 to 5 V | 0 to 1 |
| 10 to 30 kHz | 3.3 V to 250 V | 33 mA to 329.99 mA | 1 V to 3.29999 V | 0 to 1 |
| Notes <br> The range of voltages and currents shown in "DC Voltage Specifications," "DC Current Specifications," "AC Voltage (Sine Wave) Specifications," and "AC Current (Sine Wave) Specifications" are available in the power and dual output modes (except minimum current for ac power is 0.33 mA ). However, only those limits shown in this table are specified. See "Calculating Power Uncertainty" to determine the uncertainty at these points. <br> The phase adjustment range for dual ac outputs is $0^{\circ}$ to $\pm 179.99^{\circ}$. The phase resolution for dual ac outputs is 0.01 degree. |  |  |  |  |

To calculate exact ac Watts power adders due to phase uncertainty for values not shown, use the following formula:

$$
\operatorname{Adder}(\%)=100\left(1-\frac{\operatorname{Cos}(\Phi+\Delta \Phi)}{\operatorname{Cos}(\Phi)}\right)
$$

For example: At 60 Hz , for a PF of $.9205(\Phi=23)$ and a phase uncertainty of $\Delta \Phi=0.10$, the ac Watts power adder is:

$$
\operatorname{Adder}(\%)=100\left(1-\frac{\operatorname{Cos}(23+.10)}{\operatorname{Cos}(23)}\right)=0.074 \%
$$

## Calculating Power Uncertainty

Overall uncertainty for power output in Watts (or VARs) is based on the root sum square (rss) of the individual uncertainties in percent for the selected voltage, current, and power factor parameters:

Watts uncertainty $\quad U_{\text {power }}=\sqrt{U^{2} \text { voltage }+U^{2} \text { current }+U^{2} \text { PFadder }}$

VARs uncertainty $\quad$ UVARs $=\sqrt{U^{2} \text { voltage }+U^{2} \text { current }+U^{2} \text { VARsadder }}$
Because there are an infinite number of combinations, you should calculate the actual ac power uncertainty for your selected parameters. The method of calculation is best shown in the following examples (using 1 year specifications):
Example 1 Output: $100 \mathrm{~V}, 1 \mathrm{~A}, 60 \mathrm{~Hz}$, Power Factor $=1.0$ ( $\Phi=0)$.
Voltage Uncertainty Uncertainty for 100 V at 60 Hz is $190 \mathrm{ppm}+2 \mathrm{mV}$, totaling:
$100 \mathrm{~V} \times 190 \times 10^{-6}=19 \mathrm{mV}$ added to $2 \mathrm{mV}=21 \mathrm{mV}$. Expressed in percent:
$21 \mathrm{mV} / 100 \mathrm{~V} \times 100=\underline{0.021 \%}$ (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A is $0.05 \% 100 \mu \mathrm{~A}$, totaling:
$1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent:
$0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=\underline{0.06 \%}$ (see "AC Current (Sine Waves) Specifications").
PF Adder Watts Adder for PF = $1(\Phi=0)$ at 60 Hz is $\underline{0 \%}$ (see "Phase Specifications").
Total Watts Output Uncertainty $=\mathrm{U}_{\text {power }}=\sqrt{0.021^{2}+0.06^{2}+0^{2}}=0.064 \%$
Example 2 Output: $100 \mathrm{~V}, 1 \mathrm{~A}, 400 \mathrm{~Hz}$, Power Factor $=0.5(\Phi=60)$
Voltage Uncertainty Uncertainty for 100 V at 400 Hz is, $190 \mathrm{ppm}+2 \mathrm{mV}$, totaling:
$100 \mathrm{~V} \times 190 \times 10^{-6}=19 \mathrm{mV}$ added to $2 \mathrm{mV}=21 \mathrm{mV}$. Expressed in percent:
$21 \mathrm{mV} / 100 \mathrm{~V} \times 100=\underline{0.021 \%}$ (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A is $0.05 \% 100 \mu \mathrm{~A}$, totaling:
$1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent:
$0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=\underline{0.06 \%}$ (see "AC Current (Sine Waves) Specifications").

PF Adder Watts Adder for PF $=0.5(\Phi=60)$ at 400 Hz is $0.76 \%$ (see "Phase Specifications").
Total Watts Output Uncertainty $=U_{\text {power }}=\sqrt{0.021^{2}+0.06^{2}+0.76^{2}}=0.76 \%$
VARs When the Power Factor approaches 0.0, the Watts output uncertainty becomes unrealistic because the dominant characteristic is the VARs (volts-amps-reactive) output. In these cases, calculate the Total VARs Output Uncertainty, as shown in example 3:
Example 3 Output: $100 \mathrm{~V}, 1 \mathrm{~A}, 60 \mathrm{~Hz}$, Power Factor $=0.174(\Phi=80)$
Voltage Uncertainty Uncertainty for 100 V at 60 Hz is, $190 \mathrm{ppm}+2 \mathrm{mV}$, totaling:
$100 \mathrm{~V} \times 190 \times 10^{-6}=19 \mathrm{mV}$ added to $2 \mathrm{mV}=21 \mathrm{mV}$. Expressed in percent:
$21 \mathrm{mV} / 100 \mathrm{~V} \times 100=\underline{0.021 \%}$ (see "AC Voltage (Sine Wave) Specifications").
Current Uncertainty Uncertainty for 1 A is $0.05 \% \quad 100 \mu \mathrm{~A}$, totaling:
$1 \mathrm{~A} \times 0.0005=500 \mu \mathrm{~A}$ added to $100 \mu \mathrm{~A}=0.6 \mathrm{~mA}$. Expressed in percent:
$0.6 \mathrm{~mA} / 1 \mathrm{~A} \times 100=\underline{0.06 \%}$ (see "AC Current (Sine Waves) Specifications").
VARs Adder VARs Adder for $\Phi=80$ at 60 Hz is $\underline{0.03 \%}$ (see "Phase Specifications").
Total VARS Output Uncertainty $=$ Uvars $=\sqrt{0.021^{2}+0.06^{2}+0.03^{2}}=0.070 \%$

## Additional Specifications

The following paragraphs provide additional specifications for the 5522A Calibrator ac voltage and ac current functions. These specifications are valid after allowing a warm-up period of 30 minutes, or twice the time the 5522A has been turned off. All extended range specifications are based on performing the internal zero-cal function at weekly intervals, or when the ambient temperature changes by more than $5^{\circ} \mathrm{C}$.

## Frequency

| Frequency Range | Resolution | 1-Year Absolute Uncertainty, tcal $\pm 5^{\circ} \mathrm{C}$ | Jitter |
| :---: | :---: | :---: | :---: |
| 0.01 to 119.99 Hz | 0.01 Hz | $2.5 \mathrm{ppm}+5 \mu \mathrm{~Hz}{ }^{[1]}$ | 100 ns |
| 120.0 to 1199.9 Hz | 0.1 Hz |  |  |
| 1.200 to 11.999 kHz | 1.0 Hz |  |  |
| 12.00 to 119.99 kHz | 10 Hz |  |  |
| 120.0 to 1199.9 kHz | 100 Hz |  |  |
| 1.200 to 2.000 MHz | 1 kHz |  |  |

[1] With REF CLK set to ext, the frequency uncertainty of the 5522A is the uncertainty of the external 10 MHz clock $\pm 5 \mu \mathrm{~Hz}$. The amplitude of the 10 MHz external reference clock signal should be between 1 V and 5 V p-p.

Harmonics ( $2^{\text {nd }}$ to $50^{\text {th }}$ )

| Fundamental Frequency | Voltages NORMAL Terminals | Currents | Voltages AUX Terminals | Amplitude Uncertainty |
| :---: | :---: | :---: | :---: | :---: |
| 10 to 45 Hz | 33 mV to 32.9999 V | 3.3 mA to 2.99999 A | 10 mV to 5 V | Same \% of output as the equivalent single output, but twice the floor adder. |
| 45 to 65 Hz | 33 mV to 1020 V | 3.3 mA to 20.5 A | 10 mV to 5 V |  |
| 65 to 500 Hz | 33 mV to 1020 V | 33 mA to 20.5 A | 100 mV to 5 V |  |
| 500 Hz to 5 kHz | 330 mV to 1020 V | 33 mA to 20.5 A | 100 mV to 5 V |  |
| 5 to 10 kHz | 3.3 to 1020 V | $\begin{gathered} 33 \text { to } \\ 329.9999 \mathrm{~mA} \end{gathered}$ | 100 mV to 5 V |  |
| 10 to 30 kHz | 3.3 to 1020 V | $\begin{gathered} 33 \text { to } \\ 329.9999 \mathrm{~mA} \end{gathered}$ | $\begin{aligned} & 100 \mathrm{mV} \text { to } \\ & 3.29999 \mathrm{~V} \end{aligned}$ |  |
| [1] The maximum frequency of the harmonic output is 30 kHz ( 10 kHz for 3.3 to 5 V on the Aux terminals). For example, if the fundamental output is 5 kHz , the maximum selection is the 6 th harmonic ( 30 kHz ). All harmonic frequencies ( 2 nd to 50 th ) are available for fundamental outputs between 10 Hz and $600 \mathrm{~Hz}(200 \mathrm{~Hz}$ for 3.3 to 5 V on the Aux terminals). |  |  |  |  |

## Phase Uncertainty <br> $\qquad$ <br> Phase uncertainty for harmonic outputs is 1 degree or the phase uncertainty shown in "Phase Specifications" for the particular output, whichever is greater. For example, the phase uncertainty of a 400 Hz fundamental output and 10 kHz harmonic output is $5^{\circ}$ (from "Phase Specifications"). Another example, the phase uncertainty of a 50 Hz fundamental output and a 400 Hz harmonic output is 1 degree.

Example of determining Amplitude Uncertainty in a Dual Output Harmonic Mode
What are the amplitude uncertainties for the following dual outputs?
NORMAL (Fundamental) Output:
100 V, 100 Hz $\qquad$ From "AC Voltage (Sine Wave) 90 Day Specifications" the single output specification for $100 \mathrm{~V}, 100 \mathrm{~Hz}$, is $0.015 \%+2 \mathrm{mV}$. For the dual output in this example, the specification is $0.015 \%+4 \mathrm{mV}$ as the $0.015 \%$ is the same, and the floor is twice the value ( 2 x 2 mV ).
AUX (50th Harmonic) Output:
$100 \mathrm{mV}, 5 \mathrm{kHz}$.....................................................From "AC Voltage (Sine Wave) 90 Day Specifications" the auxiliary output specification for $100 \mathrm{mV}, 5 \mathrm{kHz}$, is $0.15 \%+450 \mathrm{mV}$. For the dual output in this example, the specification is $0.15 \% 900 \mathrm{mV}$ as the $0.15 \%$ is the same, and the floor is twice the value ( $2 \times 450 \mathrm{mV}$ ).

## AC Voltage (Sine Wave) Extended Bandwidth

| Range | Frequency | 1-Year Absolute Uncertainty tcal $\pm 5^{\circ} \mathrm{C}$ | Max Voltage Resolution |
| :---: | :---: | :---: | :---: |
| Normal Channel (Single Output Mode) |  |  |  |
| 1.0 to 33 mV | 0.01 to 9.99 Hz | $\pm(5.0$ \% of output <br> +0.5 \% of range) | Two digits, e.g., 25 mV |
| 34 to 330 mV |  |  | Three digits |
| 0.4 to 33 V |  |  | Two digits |
| 0.3 to 3.3 V | 500.1 kHz to 1 MHz | -10 dB at 1 MHz , typical | Two digits |
|  | 1.001 to 2 MHz | -31 dB at 2 MHz , typical |  |
| Auxiliary Output (Dual Output Mode) |  |  |  |
| 10 to 330 mV | 0.01 to 9.99 Hz | $\begin{aligned} & \hline \pm(5.0 \% \text { of output } \\ & +0.5 \% \text { of range }) \\ & \hline \end{aligned}$ | Three digits |
| 0.4 to 5 V |  |  | Two digits |

## AC Voltage (Non-Sine Wave)

| Triangle Wave \& Truncated Sine Range, p-p | Frequency | $\begin{aligned} & \text { 1-Year Absolute Uncertainty, } \\ & \text { tcal } \pm 5{ }^{\circ} \mathrm{C}, \\ & \pm(\% \text { of output }+\% \text { of range })^{[2]} \end{aligned}$ | Max Voltage Resolution |
| :---: | :---: | :---: | :---: |
| Normal Channel (Single Output Mode) |  |  |  |
| 2.9 to 92.999 mV | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}{ }^{\text {[3] }}$ | $5.0+0.5$ |  |
| 93 to 929.999 mV | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}{ }^{\text {[3] }}$ | $5.0+0.5$ |  |
| 0.93 to 9.29999 V | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}^{\text {[3] }}$ | $5.0+0.5$ |  |
| 9.3 to 93 V | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 20 kHz | $0.5+0.25$ |  |
|  | 20 to $100 \mathrm{kHz}{ }^{\text {[3] }}$ | $5.0+0.5$ |  |
| Auxiliary Output (Dual Output Mode) |  |  |  |
| 29 to 929.999 mV | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 10 kHz | $5.0+0.5$ |  |
| 0.93 to 9.29999 V | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 10 kHz | $5.0+0.5$ |  |
| 9.3 to 14.0000 V | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to 10 kHz | $5.0+0.5$ |  |
| [1] To convert p-p to rms for triangle wave, multiply the p-p value by 0.2886751 . To convert $p-p$ to $r m s$ for truncated sine wave, multiply the p-p value by 0.2165063 . |  |  |  |
| [2] Uncertainty is stated in p-p. Amplitude is verified using an rms-responding DMM. |  |  |  |
| [3] Uncertainty for Truncated Sine outputs is typical over this frequency band. |  |  |  |

## AC Voltage (Non-Sine Wave) (cont.)

| Square Wave Range (p-p) ${ }^{[1]}$ | Frequency | $\begin{align*} & \text { 1-Year Absolute Uncertainty, } \\ & \text { tcal } \pm 5{ }^{\circ} \mathrm{C}, \\ & \pm(\% \text { of output }+\% \text { of range })^{[2]} \end{align*}$ | Max Voltage Resolution |

| 0.66 to 6.59999 V | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to $10 \mathrm{kHz}{ }^{[3]}$ | $5.0+0.5$ |  |
| 6.6 to 14.0000 V | 0.01 to 10 Hz | $5.0+0.5$ | Two digits on each range |
|  | 10 to 45 Hz | $0.25+0.5$ | Six digits on each range |
|  | 45 Hz to 1 kHz | $0.25+0.25$ |  |
|  | 1 to $10 \mathrm{kHz}{ }^{\text {[3] }}$ | $5.0+0.5$ |  |
| [1] To convert p-p to rms for square wave, multiply the p-p value by 0.5 . <br> [2] Uncertainty is stated in p-p. Amplitude is verified using an rms-responding DMM. <br> [3] Limited to 1 kHz for Auxiliary outputs $\geq 6.6 \mathrm{~V}$ p-p. |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |

## AC Voltage, DC Offset

| Range ${ }^{[1]}$ (Normal Channel) | Offset Range ${ }^{\text {[2] }}$ | Max Peak Signal | ```1-Year Absolute Uncertainty, tcal }\pm5\mp@subsup{}{}{\circ}\textrm{C}\mp@subsup{}{}{[3] \pm(% of dc output + floor)``` |
| :---: | :---: | :---: | :---: |
| Sine Waves (rms) |  |  |  |
| 3.3 to 32.999 mV | 0 to 50 mV | 80 mV | $0.1+33 \mu \mathrm{~V}$ |
| 33 to 329.999 mV | 0 to 500 mV | 800 mV | $0.1+330 \mu \mathrm{~V}$ |
| 0.33 to 3.29999 V | 0 to 5 V | 8 V | $0.1+3300 \mu \mathrm{~V}$ |
| 3.3 to 32.9999 V | 0 to 50 V | 55 V | $0.1+33 \mathrm{mV}$ |
| Triangle Waves and Truncated Sine Waves (p-p) |  |  |  |
| 9.3 to 92.999 mV | 0 to 50 mV | 80 mV | $0.1+93 \mu \mathrm{~V}$ |
| 93 to 929.999 mV | 0 to 500 mV | 800 mV | $0.1+930 \mu \mathrm{~V}$ |
| 0.93 to 9.29999 V | 0 to 5 V | 8 V | $0.1+9300 \mu \mathrm{~V}$ |
| 9.3 to 93.0000 V | 0 to 50 V | 55 V | $0.1+93 \mathrm{mV}$ |
| Square Waves (p-p) |  |  |  |
| 6.6 to 65.999 mV | 0 to 50 mV | 80 mV | $0.1+66 \mu \mathrm{~V}$ |
| 66 to 659.999 mV | 0 to 500 mV | 800 mV | $0.1+660 \mu \mathrm{~V}$ |
| 0.66 to 6.59999 V | 0 to 5 V | 8 V | $0.1+6600 \mu \mathrm{~V}$ |
| 6.6 to 66.0000 V | 0 to 50 V | 55 V | $0.1+66 \mathrm{mV}$ |
| [2] The maximum offset value is determined by the difference between the peak value of the selected voltage output and the allowable maximum peak signal. For example, a 10 V p-p square wave output has a peak value of 5 V , allowing a maximum offset up to $\pm 50 \mathrm{~V}$ to not exceed the 55 V maximum peak signal. The maximum offset values shown above are for the minimum outputs in each range. |  |  |  |

## AC Voltage, Square Wave Characteristics

| Risetime @ <br> $\mathbf{1} \mathbf{~ k H z}$ <br> Typical | Settling Time @ <br> $\mathbf{1 ~ k H z}$ Typical | Overshoot <br> @ $\mathbf{1} \mathbf{~ k H z}$ <br> Typical | Duty Cycle Range | Duty Cycle Uncertainty |

| $0.3 \%$ of $p-p$ value, from $10 \%$ to $90 \%$ point | $<1 \%$ of $p-p$ value, with amplitude $>50 \%$ of range |

## Change \#2

On page 1-4, under Safety Information, remove first sentence and the four bullets.
On page 1-4 and 1-5, replace the Warning section with:

## 今 $\triangle$ Warning

To prevent possible electrical shock, fire, or personal injury:

- Use the Product only as specified, or the protection supplied by the Product can be compromised.
- Carefully read all instructions.
- Do not use the Product around explosive gas, vapor, or in damp or wet environments.
- Use this Product indoors only.
- Do not touch voltages $>30 \mathrm{~V}$ ac rms, 42 V ac peak, or 60 V dc.
- Do not use the Product if it operates incorrectly.
- Do not use the Product if it is damaged.
- Disable the Product if it is damaged.
- Do not use test leads if they are damaged. Examine the test leads for damaged insulation, exposed metal, or if the wear indicator shows. Check test lead continuity.
- Use only cables with correct voltage ratings.
- Connect the common test lead before the live test lead and remove the live test lead before the common test lead.
- Use only the mains power cord and connector approved for the voltage and plug configuration in your country and rated for the Product.
- Make sure the ground conductor in the mains power cord is connected to a protective earth ground. Disruption of the protective earth could put voltage on the chassis that could cause death.
- Replace the mains power cord if the insulation is damaged or if the insulation shows signs of wear.
- Do not connect directly to mains.
- Do not use an extension cord or adapter plug.
- For safe operation and maintenance of the Product, make sure that the space around the Product meets minimum requirements.
- Remove the signal leads before cleaning the product.
- Use only the specified replacement fuses.
- Use only the specified replacement parts.

On page 4-3, add the following at the end of the page:

## General Cleaning

For general cleaning, wipe the case, front panel keys, and lens using a soft cloth slightly dampened with water or a non-abrasive mild cleaning solution that does not harm plastics.
$\triangle$ Caution
Do not use aromatic hydrocarbons or chlorinated solvents for cleaning. They can damage the plastic materials used in the Product.

## Change \#3

On page 3-6, replace step 7 with:
7. Measure and type the values into the UUT for steps 1 through 5 in Table $3-3$ as instructed. Disconnect and reconnect the reference multimeter as instructed in these steps.
Replace Table 3-3 with:
Table 3-3. Calibration Steps for DC Volts

| Step | Calibrator Output (NORMAL) |
| :---: | :---: |
| 1 | 3.000000 V |
| 2 | -3.000000 V |
| 3 | 0.0000 mV |
| 4 | $0.000000 \mathrm{~V}^{[1]}$ |
| 5 | 300.0000 mV |
| 6 | 30.00000 V |
| 7 | 300.0000 V |
| 8 | 1000.000 V |
| 9 | 1000.000 V |
| $[1] 5522$ main software version 1.3 and later and 5502A and 5502 E main software version 1.4 and later. |  |

On page 3-7, replace step 4 with:

1. Measure and type the values into the UUT for steps 6 through step 9 in Table 3-3 as prompted.
