# INTRODUCTION

Congratulations on the purchase of your new Wide Band Amplifier from Instruments For Industry, Inc. Your new Wide Band Amplifier incorporates the finest advancements in state of the art solidstate electronics technology available in a compact, portable and versatile package. Your Wide Band Amplifier's quality, performance and trouble free operation depends on you thoroughly reading through this manual and familiarizing yourself with its proper operation and usage.

Your Wide Band Amplifier comes with the following accessories, be sure to check your packaging for the items listed below before disposing of the packaging.

#### **CONTENTS**

(For a typical Wide Band Amplifier )

<u>Quantity</u>	<b>Description</b>
1	High Power Wide Band Amplifier, Model S251-250
1	AC power line cord
1	Operation and Instruction Manual, Doc. No. S251-250
1	Amplifier Data Sheets (Included with Unit)

# FIGURE 1.0 S251-250 ILLUSTRATION

# SECTION 2.0

# GENERAL DESCRIPTION

The Instruments for Industry, Inc. (IFI) manufactured S251-250 Wide Band Amplifier is a Bench Top or rack mount amplifier providing 250 Watts of RF power from 800 MHz to 2500 MHz instantaneously.

The Amplifier features a Color Touchscreen that displays continuous forward and reflected power in three-digit metering. The display also scrolls to provide the operator with operating status and self-diagnostic fault indications.

The Amplifier is unconditionally stable and incorporates protection circuits that monitor and control the VSWR input and outputs so the amplifier cannot be damaged by any mismatched load.

The Amplifier may be equipped with an IEEE-488 BUS & RS232 interfaces, which allows the amplifier to be remotely controlled through the use of as computer.

To operate the Amplifier, connect the single phase power line cord to the IEC connector on the rear panel.

# SECTION 3.0

# WARRANTY INFORMATION

Instruments For Industry, Inc. (IFI) warrants each product of its manufacture to be free from any defect in material and workmanship for a period of three years from shipment to the original purchaser. All warranty returns, however, must first be authorized by our factory office representative. Refer to the Service Section for information on how to return items for warranty repair.

Warranty liability shall be limited to repair or replacement of, or part thereof, which proves to be defective after inspection by IFI. This warranty shall not apply to any IFI product that has been disassembled, modified, physically or electrically damaged or any product that has been subjected to conditions exceeding the applicable specifications or ratings.

IFI shall not be liable for any direct or consequential injury, loss or damage incurred through the use, or the inability to use, any IFI product.

IFI reserves the right to make design changes to any IFI product without incurring any obligation to make the same changes to previously purchased units.

This warranty is the full extent of obligation and liability assumed by IFI with respect to any and all IFI products. IFI neither makes, nor authorizes any person to make, any other guarantee or warranty concerning IFI Products.

#### **SECTION 4.0**

# **GENERAL INFORMATION**

# 4.1 SCOPE OF THIS MANUAL

This manual is intended to inform a qualified transmitter operator or technician of the normal operating and maintenance procedures for the S251-250. It is not intended to be a course of instruction for unqualified personnel.

# 4.2 GENERAL SPECIFICATIONS

The specifications listed below represent the minimum performance characteristics at the time of delivery.

#### **SPECIFICATIONS**

Frequency Response:	800 - 2500 MHz
Power Output:	Minimum 250 Watts
AC Source:	220VAC, 50/60, Single Phase
Power Gain:	54 dB
Input Impedance:	Nominal 50 Ohms unbalanced
Output Impedance:	Nominal 50 Ohms unbalanced
Input Signal Levels:	< 0  dBm ( 1.0 mW ) See data sheet for specific input drive levels
Duty Cycle:	CW
Spurious:	-50dBc

# 4.3 PROTECTION CIRCUITS

The S251-250 is designed with a variety of protection circuits to provide safeguards for the amplifier should any adverse electrical conditions occur or if the amplifier accidentally experiences operator deviation of the design application. Listed below are the safeguards built into the S251-250.

# 4.3.1 Over Heat Protection

The S251-250 critical components are mounted to heat sinks, which are, in turn, air cooled by four fans. Should an over heating condition occur, either through component failure or by a restricted airflow, the S251-250 contains heat sensors that will shut down the system. As a result, the air inlet and outlet openings should be free of obstructions for proper cooling of the amplifier. Operation is restored after Fault Reset when the amplifier cools to normal temperature levels.

# 4.3.2 Input Protection

The S251-250 is designed to operate with less than a 0 dBm (1.0 mW) input signal however, to prevent overdriving the amplifier, the Input Protection circuit will activate if the input signal exceeds 3 dBm (2.0 mW) and will automatically compensate for the increased input signal by reducing the gain of the preamplifier. Even though the amplifier has an Input Protection Circuit, overdriving the amplifier is not recommended; refer to paragraph 5.1.2 for more details.

#### 4.3.3 Output Protection

The S251-250 incorporates a microprocessor controlled Output Protection Circuit which monitors the Forward Power Meter indication and limits the output power. This feature protects the amplifier from being over driven and causing damage to the power transistors.

It is important to note that this feature only operates when the Forward and Reverse Sample Ports on the amplifier have 50 Ohm Terminations installed.

#### **IMPORTANT NOTE:**

The S251-250 Sample RF Output connector must be terminated with the supplied 50 Ohm load if the output is not being used. Should the S251-250 be operated without a termination on the Sample RF Output connection will jeopardize the accuracy of the metering and output protection; which are based on the Forward Power Readings, which may result in damaging the amplifier and voiding the unit's warranty.

### 4.3.4 Power Supply Faults

The Power Supply Fault circuit monitors the 50 VDC,  $\pm$  12 VDC and 5 VDC power supplies and produces a fault indication should any voltage level deviate from normal operating parameters. Each power supply voltage output is monitored and displayed to indicate the power supplies are operating within design parameters. Some units may have Green Status LED Indicators in addition to the Controller Display. Should any power supply voltage deviate from the design parameters, the corresponding power supply fault will be displayed

# 4.3.5 Mismatch Protection

The S251-250 is designed to operate with a tuned 50 Ohm load and should any mismatching of the 50 Ohm load occur, the Reverse Power, also called Reflective Power, will increase producing a high VSWR. The S251-250 microprocessor monitors the Reverse Power levels by utilizing a Dual Directional Coupler and begins to turn down the gain of the preamplifier when the Reflected Power exceeds 40%. The Reverse Power is also displayed on the LCD Display for operator monitoring for any mismatched load.

#### 4.3.6 Short Circuit Protection

The S251-250 utilizes three different power supply voltages, + 32 VDC,  $\pm$  12 VDC and the + 5 VDC, each of the power supplies are designed with a short circuit and overload protection device.

# 4.4 STATUS INDICATORS, CONTROLS AND CONNECTORS

The S251-250 has various controls and status indicators, which are identified below and can be visually located on Figure 1.0, S251-250 Illustration and Figure 2.0, S251-250 Rear Panel Illustration. A narrative description for the function and purpose of each control and status indicator is provided within paragraphs 4.4.1 and 4.4.2.

#### S251-250 RF AMPLIFIER

Front Panel:

Rear Panel:

Local/Remote Switch Amp ON / OFF Switch Operate / Standby Switch Fault/Reset Switch Color Touchscreen Display RF Input, N Type, Female FWD Sample Port,'N' Type Female RF Output, N Type, Female AC PWR, IEC Power Connector ALC INPUT, BNC Type (Optional) INTERLOCK, BNC Type (Optional) IEEE-488, Connector RS232 Connector RF Input, N Type, Female FWD Sample Port,'N' Type Female RF Output, N Type, Female

### 4.4.1 S251-250 PANEL STATUS INDICATORS

# **FUNCTION INDICATOR** FAULT INDICATOR The Fault indicator displays a fault when either a Thermal, Power Supply or Module Fault occurs on Front panel display. Some units may have Green Status LED Indicators in addition to the Controller Display. A Thermal Fault occurs when the amplifier is operating outside design temperatures. Should an excessive temperature condition occur, the +50 VDC Supply is shut down and a Power Supply fault is indicated. Once the thermal condition returns to the operational limits, the +50VDC Supply will activate. A Power Supply Fault is displayed when the +50 VDC Power Supply voltage shuts down. Hi VSWR When the Hi VSWR fault is displayed; the amplifier is subjected to a condition where the Reflected Power exceeds 40%. The microprocessor turns down the gain of the preamplifier and displays the Reverse Power on the LCD Display. RMT /LCL When remote displays on the front panel the amplifier is in the remote control mode of operation via the IEEE-488 GBIP Bus. The address selection can be done through the front panel using the Control Knob. Follow instructions on the LCD display. TOTL/OPRT HOUR Elapsed time Indication on the LCD display, presents total hours of the amplifier or operate hours that it has been energized.

# 4.4.2 S251-250 CONTROLS

CONTROL	<b>FUNCTION</b>				
Local	When depressed, the amplifier is restored to the local control from the GPIB mode of control.				
ALC Switch	The optional Automatic Leveling Control (ALC) is a feature, which selects the method for leveling, either internal, external or manual.				
Power ON/OFF	The Power On/Off switch is a circuit breaker that is used as an On/Off switch as well as a circuit protection device. This switch turns the driver either on or off.				
Control Level Adjust Knob	The optional Level Adjust control is a ten-turn pot, which allows a minimum of a 30 dB range of gain. Turning the control Counter Clockwise (CW) produces a minimum gain.				
	<b>Important Note:</b> If the amplifier is not equipped with this option, the display will still indicate a GAIN percentage (refer to Figure 5.0). This percentage indication is still controlled by Level Adjust Control but the both the Level Adjust Control and the corresponding GAIN percentage indication has no effect on the amplifier gain.				
FLT/RST	The Reset/Fault (FLT/RST) is a reset switch that resets the fault indication. If a fault indication is present, the fault indication can remove the by depressing this switch.				
OPR/STB	The Operate/Standby (OPR/STB) switch which when the switch is set in the Standby mode, the Power Supply is turned off to the amplifier circuitry. When set in the Operate mode, the Power Supply delivers voltage to the amplifier circuitry.

FIGURE 6.0 – TURNING ON THE AMPLIFIER (Typical)

- 1. From the MAIN MENU in Figure 6.0, press the STBY /OPRT Soft Key and the color of the button will change to Green
- 2. The display will show the Main DC power supply Voltage and current as per AMPLIFIER operating data sheet (enclosed in the manual).

### 4.6 DATA SHEETS

Provided with each S251-250 are specific Amplifier Data Sheets measured from the amplifier using a calibrated 50 Ohm Pad to assist the operator in maximizing the performance of the Wide Band Amplifier.

The Amplifier Data Sheets are provided with each amplifier exhibiting the actual metering indication required to produce rated power output as indicated on the data sheet. The actual metering values were derived by measuring the power output of the amplifier using a calibrated Power Meter and a calibrated 30 dB Attenuator Pad by inducing an appropriate input signal level to obtain rated power output. Once the appropriate signal level has been determined to obtain the desired power level, the actual Front Panel Metering Indication correlates to that power level.

The amplifier data sheets provide the operator with the over all frequency response of the amplifier in perspective to the amplifier operating frequency ranges. The amplifier data sheets provide the operator with the actual gain of the amplifier over the frequency band.

The Amplifier Data Sheets are located within Appendix A

#### **SECTION 5.0**

# PRINCIPLES OF OPERATION

### 5.1 PROPER USAGE AND WARNINGS

#### **5.1.1 Controlling Power Output**

With a nominal 50 ohm resistive load and an input signal appropriate to produce a power output within the limitations specified above, the amplifier may be placed in operation. To interrupt the output, simply interrupt the input signal or increase the input attenuation setting to produce commensurate output level reduction. The amplifier may be run indefinitely at rated output. Output power is usually measured with a power meter and suitable power attenuators.

#### 5.1.2 Input Signal Levels

The S251-250 is designed to operate with less than a 0 dBm (1.0 mW) input signal however, to prevent over driving the amplifier, the Input Protection circuit will activate if the input signal exceeds 3 dBm (2.0 mW) and will automatically compensate for the increased input signal by reducing the gain of the preamplifier.

It is not advisable to overdrive any amplifier and depend on protection circuits to maintain proper gain control. IFI makes available with each shipped amplifier, specific amplifier data so the operator will know the proper input signal levels to more efficiently operate the amplifier. Refer to the test data sheets information located in Paragraph 4.6 herein.

#### 5.1.3 Sample RF Output Cautions

The S251-250 Sample RF Output connector located on the rear panel must be terminated with the supplied 50 Ohm load if the output is not being used. Should the S251-250 be operated without a termination on the Sample RF Output connection, the lack of loading will jeopardize the accuracy of the metering and output protection; which are based on the Forward Power Readings.

**Important Note:** If the amplifier is operated without the 50 Ohm termination, damage to the amplifier may occur which would void the units warranty.

# 5.2 FEATURES OF THE S251-250 AMPLIFIER

The S251-250 amplifier is intended for applications requiring high gain and power output to 200 Watts, over a wide range of frequencies, without tuning adjustments. The S251-250 amplifies an input signal source over the frequency range from 800 MHz to 2500M Hz and at a minimum gain of 53dB

#### FIGURE 7.0 S251-250 SCHEMATIC DIAGRAM

#### 5.2.1 Preamplifier or Optional Preamplifier/Attenuator

The S251-250 amplifier has a preamplifier with approximately 10dB gain; which is powered from an independent low voltage power supply.

If the amplifier is equipped with the Optional Preamplifier/Attenuator, it provides the amplifier with remote level control and leveling capability over the entire operating frequency range. With the front panel level control set at maximum output it has a nominal 4 dB gain and can be adjusted with the front panel level control over a greater than 30 dB range.

#### 5.2.2 Power Amplifier - continued

This amplifier consists of four amplification sections, the final stage having four cascaded highpower, push-pull devices operating in parallel and combined through a transmission type impedance transformer.

#### **5.3 MANUAL LEVEL CONTROL**

Manual level control is accomplished by adjusting the front panel ten-turn potentiometer, located on the power supply control unit, to a reference voltage setting between 0 to 5 volts.

#### 5.3.1 Automatic Level Control

In this mode, the S251-250 serves as the voltage comparator and variable gain stage. It will enable the maintenance of a constant RF voltage vs. frequency at the input to an imperfect load or a virtually constant E-Field at a measurement point in space. For further information regarding the ALC operation, refer to Section 6.0.

# 5.4 OPTIONAL FEATURES

#### **5.4.1 Interlock Feature**

The Interlock Feature is an option for the S251-250 that utilizes an Electro Magnetic Interference (EMI) Testing Room door switch that is mounted to the door in such a manner that when opened, the switch will automatically induce an ordered shut down of the amplifier and produce a STAND-BY MODE indication on the LCD Metering Display. When the door is closed, the amplifier resumes previous testing conditions.

The advantage to this feature is providing an additional safety feature for the growing concerns for potential hazards due to exposure to EMI Fields. With the Interlock option, all Testing Personnel will be protected from accidental exposure to EMI Fields. Should the operator desire this optional feature, the amplifier can be returned to IFI for installation. Refer to Section 8.0 for Equipment Return Procedure.

#### **SECTION 6.0**

# AUTOMATIC LEVELING CONTROL

### 6.1 ALC FEATURES

The Automatic Leveling Control (ALC) switch located on the front panel has three positions, 'INT', 'OFF' and 'EXT'. Described below are the features of each position

**Important Note:** Figures 5.0 and 6.0 indicates the display for a typical amplifier and the ALC option is indicated however if the amplifier is not equipped with this option, the ALC option will not be displayed.

# 6.1.1 The 'INT' Position

The 'INT' or Internal position enables the amplifier to automatically level on an RF power level selected by an operator displayed on the Forward Power reading located on the Front Panel LCD display. Using the 'INT' feature, no external sources are required for leveling control and the operator determined power level will be automatically maintained even though the frequency or input signal levels might change. Refer to Paragraph 6.2 for the procedure to operate the amplifier in the 'INT' mode.

#### 6.1.2 The 'OFF' Position

The 'OFF' position enables the amplifier to operate in a passive mode with no automatic features controlling input drive levels or output power levels. In this mode, the operator has full manual control of the amplifier including the input signal gain, frequency and power output. As a result, the operator must be fully knowledgeable of the effects of these variables in relationship to the operating characteristics of the amplifier. With this in mind, the two most important factors are the dB flatness of the amplifier over the operating frequency range and the rated output power of the amplifier.

Depending on the response curve provided on the S21 Parameter Plot for the amplifier flatness, which is located within Appendix A, and the size of the frequency steps of the signal generator can increase or decrease the power level by as much as 4 dB. This is the result of the design tolerance of the amplifier to operate within  $a \pm 2 dB$  over the rated frequency range.  $A \pm 2 dB$  tolerance means that the maximum deflection from minimum to maximum of the flatness curve can represent a delta change up to 4 dB. With this factor in mind, it is advisable to identify the specific frequencies that represent the greatest change from the nominal 0 dB level and adjust the input signal accordingly in so that the amplifier is not over driven beyond the rated power specification. Taking these precautions will prolong the reliability on the amplifier.

# 6.1.3 The 'EXT' or External Position

The S251-250 serves as the voltage comparator and variable gain stage. It will enable the maintaining of a constant RF voltage vs. frequency at the input to an imperfect load or a virtually constant E-Field at a measurement point in space.

The front panel, ALC control, switches direct level control from the front panel Level Control potentiometer to the output of a linear comparator. The comparator output level is dependent on the reference input from the front panel Level Control and the input from the aforementioned detected voltage or E-Field. The total gain of the leveling loop serves to maintain the output of the comparator virtually constant and thus maintain the desired test level at the remote detector or remote E-Field sensor.

The 'EXT' position enables the amplifier to automatically control an operator determined power level by means of an external 0.0 to 5.0 VDC reference source connected to the External Source connector. An example of a 0.0 to 5.0 VDC external input would be the output of a LDI or an EFS. Refer to Paragraph 6.3 for procedures on leveling with an external voltage level.

# 6.2 LEVELING USING THE 'INT' MODE

When in the INT position, no outside controls are required. The only equipment required is a frequency generator and the intended load. The procedure to use Internal ('INT') Leveling is described below:

- 1) Turn the RF Level Potentiometer fully counter clockwise to Full Attenuation.
- 2) Set the ALC Switch to the 'INT' position.
- 3) Set the Signal Generator to the proper input drive level to obtain the desired power level. Identify the desired testing parameters and determine the required input drive levels from the Amplifier Data Sheets provided within Appendix A It is important to determine that sufficient signal drive signal is generated to obtain and maintain the desired programmed power level. An adequate load capable to operate within the power requirements should also be selected.
- 4) Adjust the RF Level Potentiometer until the desired Forward Power Level is displayed on the front panel LCD display.
- 5) The amplifier is now ready to sweep a frequency range and automatically maintain the desired power level with no further adjustments required. The power level will be maintained at the operator set level and remain independent of changes to the input frequency or input signal level.
- 6) When sweeping the frequency range, best results are obtained at a sweep rate that is slower than 500 ms.

# 6.3 LEVELING USING THE 'EXT' MODE

When operating the amplifier in the External (EXT) mode, it is important to understand that the power output levels are determined by the external voltage reference source. The applicable Amplifier Data Sheets should be reviewed to determine the appropriate drive signal level so that the amplifier does not exceed the specified power output rating. As described in paragraph 6.1.2, due to the flatness curve tolerances at certain frequencies, the rated power output power could be exceeded by an additional 40% and that will jeopardize the longevity of the amplifier. The amplifier should not be over driven and should a particular application require additional power beyond the rated power of the S251-250, contact IFI's Customer Service for additional high powered amplifiers.

Detailed below are specific applications for using the External (EXT) Mode with a variety of external inputs.

# 6.3.1 Constant RF Voltages Verses Frequency At A Remote Load

With remote detectors suitably rated for power and frequency, the S251-250 provides the means for feeding a mismatched load with constant RF drive voltage over the entire frequency range. Full leveling, at half the S251-250 rated output power, is realizable with most reasonable load variations. Extremely mismatched loads, particularly those presenting near short circuit conditions to the amplifier, will reduce the maximum voltage leveling capability of the system. Load impedance variation from 50 Ohms to an open circuit will permit peak voltage leveling within the VSWR capability of the amplifier. Variations in impedance from 50 Ohms down to a short circuit will rapidly diminish the peak voltage leveling capability toward zero. Amplifier VSWR limitations will, of course, further limit the maximum leveled voltage into mismatched low impedance loads.

To operate in this mode, after selecting the desired band, place the ALC switch in the EXT position. Connect the ALC on the rear panel to the detected output port on the remote detector. Connect the remote detector in series with the S251-250 output and at the input to the load. The system is now ready for operation. Amplitude adjustments can be made with the level control as in manual operation.

**NOTE:** When the S251-250 is used as a driver for higher power amplifiers, automatic level control can be accomplished in the same manner but at the power and frequency limitations of the driven amplifier.

#### **SECTION 7.0**

### **IEEE-488.2 INTERFACE**

#### 7.1 INTRODUCTION

The Instruments For Industry, Inc. (IFI) Amplifiers can be operated remotely from a personal computer having an IEEE-488 interface. This interface allows the amplifier to be remotely controlled over the General Purpose Interface Bus (GPIB) by sending commands to the amplifier. Additionally, amplifier status and forward and reverse power readings may be read over the GPIB. All functions can be controlled by coded messages sent over the interface bus via the 24-pin socket connector on the rear panel of the unit. IEEE-488.2 Standard is implemented, which defines the protocols and syntax of commands. The GPIB command codes for the IFI Amplifier series are discussed on subsequent pages and, for ease of identification; the command codes are identified within the text by bold capital characters. For full information on the IEEE protocols and syntax the IEEE-488.2 Standard should be consulted.

#### 7.2 REMOTE INITIALIZATION

When the amplifier receives a command over the GPIB, it automatically switches to REMOTE operation, pressing the LOCAL key on the front panel returns the unit to normal manual local operation. The initial state of the amplifier after power-on is the full attenuation condition. The ZEROATT command must be sent in order for the amplifier to be able to generate output power.

#### 7.3 GPIB ADDRESS

The GPIB address of the amplifier is set by via the Front panel using the Control knob at the start up menu..

#### NOTES ON USING NATIONAL INSTRUMENTS' GPIB CONTROLLERS:

In order for the amplifier to operate correctly with a National Instruments GPIB controller card, the following must be done: (Items 1-5 are done in the IBCONF program.)

- 1. Set "Terminate reads on EOS" to yes.
- 2. Set "Set **EOI** with **EOS** on Writes" to **yes**.
- 3. Set the **EOS** byte to **0Ah** (an ASCII line feed character).
- 4. Set "Send EOI at end of writes" to yes.
- 5. Set "Enable **repeat addressing**" to **yes** at the board level.
- 6. When sending command strings to the amplifier, a carriage return character (**0Dh**) followed by a line feed character (**0Ah**), must always be appended to the command, otherwise the amplifier will wait indefinitely for the **CR-LF** combination. If this happens the unit will have to be powered off and back on to reset this condition. (The interface device will automatically assert the **EOI** line during the **LF** if items 2 4, above, are set to yes in the IBCONF program.) As an example, when issuing the zero attenuation command using the IBIC or WIBIC program, the command string would look like this: "**ZA**\**r**\**n**". (The \r is National Instruments' notation for the carriage return, and the \n is the line feed or 'new line' character.) Notice that the commands are upper case only.

# Commands for Solid State Amplifier

Code	Amplifier Function		
STBY	Standby & Returns 'SB'		
OPRT	Operate & Returns 'ON'		
RESET	Fault Reset & Returns 'STANDBY'		
ATTUxx	Increase Attenuation (xx- # of steps) [Response with Gain value, 'GAIN: XXXXX %']		
ATTDxx	Decrease Attenuation (xx- # of steps) [Response with Gain value, 'GAIN: XXXXX %']

PS2V	Returns Power Supply 2 Volts Value, [If Applicable]
PS2I	Returns Power Supply 2 Current Value [ If Applicable ]
PS3V	Returns Power Supply 3 Volts Value, [If Applicable]
PS3I	Returns Power Supply 3 Current Value [ If Applicable ]
PS4V	Returns Power Supply 4 Volts Value, [If Applicable]
PS4I	Returns Power Supply 4 Current Value [ If Applicable ]
TOTALH	Returns Total hours unit is on, 'TOTAL HRS: XXXXX'
OPERATEH	Returns Operation Hours Value, 'OPERATE HRS: XXXXX'
BAND1	Selects Band 1 of Operation [ In Dual Band units only ]
BAND2	Selects Band 2 of Operation [ In Dual Band units only ]
NOLEV	Selects NO Leveling [Optional]
INTLEV	Selects INTERNAL Leveling [Optional]
EXTLEV	Selects EXTERNAL Leveling [Optional]
QUIETOFF	Selects QUIETING to OFF [Optional]
QUIETAUTO	Selects QUIETING to AUTO mode [Optional]
QUIETSTATUS	Returns Quieting mode of operation [ Optional ]
	<b>'QUIETING OFF'</b>
	'QUIETING AUTO'
ZEROATT	Sets the Amplifier for ZERO Attenuation & Returns, 'GAIN: 00100 %'
FULLATT	Sets the Amplifier for FULL Attenuation & Returns, 'GAIN: 00000 %'
GAIN	Returns Gain Value in percentage, 'GAIN: XXXXX%'
MODEL	Returns Model number of the unit
SN	Returns Serial number of the unit
*IDN?	Returns ASCII response comprising of four data fields in the format
	<manufacturer>, <model>, <serial number="">, <firmware version=""></firmware></serial></model></manufacturer>
*RST	Reset Command, Sets the Amplifier to the factory default power up state (reboots MPU)

#### NOTES:

# 1. ALL GPIB COMMANDS AND REQUESTS MUST CONSIST ENTIRELY OF UPPER CASE ALPHANUMERIC CHARACTERS.

2. WHEN SENDING COMMAND STRINGS TO THE AMPLIFIER, A CARRIAGE RETURN CHARACTER (**0Dh**) FOLLOWED BY A LINE FEED CHARACTER (**0Ah**), MUST ALWAYS BE APPENDED TO THE COMMAND, and OTHERWISE THE AMPLIFIER WILL WAIT INDEFINITELY FOR THE **CR-LF** COMBINATION.

# RS-232 or USB

# **Operation of Serial Port on RF Amplifier**

1 – Connect serial port of amplifier to computer using a null modem cable or a standard serial cable with a null modem adapter.

2 – Use a program such as Hyperterm to communicate with the amplifier. (To reach "Hyperterm" on windows '98 go to Start  $\rightarrow$  Programs  $\rightarrow$ Accessories  $\rightarrow$  Communications  $\rightarrow$  Hyper Terminal. In Hyper terminal double click on

In Hyperterm do the following:

- 2.1 Enter a name and choose an icon.
- 2.2 In the connect using box select "Direct to Com1".
- 2.3 Click OK.
- 2.4 Select 9600 baud.
- 2.5 In Data Bits select 8
- 2.6 In Parity Select "None"
- 2.7 In Stop bits select "1".
- 2.8 In Flow control select "None"
- 2.9 Press enter.
- 3 If you use Hyperterm steps 2.1 to 2.9 will set up Com1 to communicate at 9600 baud, 8 bits, and no parity with 1 stop bit.
- 4 Turn amplifier line power ON.

To place the amplifier in remote operation type in a valid command such as "STATUS". The amplifier will then go into remote operation and the status will be displayed on the computer. The same commands as above.

5 – When used with an RS-232 or RS-422 interface each character that is sent to the amplifier is echoed back.

# <u>RS-422</u>

#### Communication Interface

Communication Standard Communication Baud Rate Communication Update Rate Average Data Latency Data Latency Variation Control Functions Report Data

RS422 19200 50 Hz 100 mSec 100 mSec Status Request, Mode Selection, BIT activation Amplifier Status, BIT results

Data rate is 9600 baud, 1 or 2 stop bits, no parity.

# **Example**

# The commands are the same as above.

Command: Place unit in operate mode ASCII String sent to amplifier: ON(cr)(lf) Hex equivalent of string: 0x4f, 0x4e,0x0d,0x0a Response: None Response String from amplifier: None Example of response: N/A Hex value of example: N/A

Command: Read forward power ASCII String to amplifier: POWERFWD(cr)(lf) Hex equivalent of string: 0x50,0x4f,0x57,0x45,0x52,0x46,0x57,0x44,0x0d,0x0a Action: None Response: Responds with forward power Response String from amplifier: POWER FWD: xxxxx W(cr)(lf) Where xxxxx is the value of the power Example of response : POWER FWD: 09005 W(cr)(lf) Hex value of example : 0x50,0x4f,0x57,0x45,0x52,0x20,0x46,0x57,0x44,0x3a,0x20,0x30,0x39,0x30,0x35,0x20,0x57, 0x0a,0x0d

# **SECTION 8.0**

#### MAINTENANCE AND SERVICING

#### 8.1 PERIODIC MAINTENANCE

The only periodic maintenance required on the S251-250 amplifier system is ensuring that the cooling vents are not obstructed in such a manner that the airflow is restricted. Periodic cleaning of the vents may be required depending on the degree of dust in the atmosphere.

#### 8.2 SERVICING THE AMPLIFIER

Servicing of the amplifier by the operator is not recommended. Most of the internal circuitry requires special and unique test instruments to trouble shoot, align and calibrate the circuits. Should servicing be required, refer to Paragraph 8.3.

#### 8.2.1 TROUBLESHOOTING

PROBLEM	CAUSE	SOLUTION	COMMENTS
Touchscreen display blank	No service voltages	Check line power. Check service voltages, +12VDC, -12Vdc, 5VDC	Connect AC line to specified Prime power source. Refer to S/N tag on unit
Amp will not go to Operate mode	Door interlock open,	Check that door interlock BNC connector is terminated with either 50 Ohms or short.	
Power Supply fault	Main Power supply faulty	Check either for 32VDC	Check on the LCD display for the fault description.
Thermal fault	Over-heating	Make sure airflow is adequate and ambient temperature within the limit.	
Meter Inaccuracy	Un-terminated Forward and/or Reverse Sample Ports	Use 50 Termination on Forward and Reverse Sample Ports	

# 8.3 EQUIPMENT RETURN PROCEDURE

Should the S251-250 require repair or it is recommended that the reader follow the Equipment Return Procedure so the equipment can be repaired or calibrated and returned in an efficient and timely manner.

#### 8.3.1 Request a RMA Number

Contact the IFI Service Department either in writing or by calling (631) 467-8400 and request a Return Material Authorization (RMA) Number.

The RMA Number is the method IFI uses to prepare its services for returned material in transit and acts as a tracking document for the returned material through the repair or process.

The RMA also documents the customer's specific instructions or reason related to the return of the material.

#### 8.3.2 Return All Accessories

In the interest of saving time and expediting the repair or process, return all the associated accessories described in Section 1.0 when returning the equipment for repair.

In many cases, a faulty accessory could give the illusion that the equipment itself has failed. For this reason it is important to return all the accessories with the equipment. It is also IFI's policy to verify performance of all associated accessories of Section 1.0 before returning the equipment to service.

#### 8.3.3 Packaging The Equipment

When returning equipment to the manufacturer, always wrap each accessory separately, and provide sufficient protective material around each item to prevent damage from handling and shipping conditions. It is **strongly** recommended the equipment be returned in its **original wooden crate** (or equivalent) for maximum protection. Cardboard boxes do not provide sufficient protection of the equipment.

#### 8.3.4 Reference The RMA Number

As detailed in Paragraph 8.3.1, always reference the IFI assigned RMA Number on your Packing List and Purchase Order and when any inquiries are made.
