I cannot get these to work and my IDA skills are too bad to figure out what is happening.

As I said in the other thread, there should also be a debug console available that is accessible through TCPIP but I cannot figure out how to connect to it....

DPO3000 Hacks - Page 1

As I said in the other thread, there should also be a debug console availble that is accessible through TCPIP but I cannot figure out how to connect to it....

Jay

OK, so using telnet didn't work, but using my browser (Firefox) brings up a Tektronix menu. I selected the tab "DATA" and I'm able to talk to the scope using GPIB commands. I then sent the following per abyrvalg's post:

:SETMODELID 5 :HWAccountant:ACQBandwidth 500

Then power-cycled the unit. It did not make any changes. So I used the back door password first:

:PASSWord "INTEKRITY" :SETMODELID 5 :HWAccountant:ACQBandwidth 500

Then power-cycled the unit again. Still no change. I'm probably doing something wrong; I'm an idiot when it comes to stuff like this... -

Jay

OK, it's confirmed, I am an idiot. Remove the quotes around the password: :PASSWord INTEKRITY :SETMODELID 5 :HWAccountant:ACQBandwidth 500

Voila, it reports that it is a MSO5054!

Thank you very much abyrvalg! 🚇 Now to do some bandwidth testing!

Great! 🙄 Try ARMDEMO also - my guess it should enable all options for a specified number of days.

Huh. That didn't seem to work...

I tried both: :ARMDEMO DontMakeTheWookieMad, 30 :ARMDEMO DontMakeTheWookieMad 30

Wasn't sure about the comma...

My firmware revision is 2.07 - perhaps that may play into the equation as it's rather old.

In other news, with a 500MHz 600mV signal applied from my signal generator to each channel in 50 Ohm mode, all four channels measure a minimum of 520mV, so the scope exceeds the specification of a MSO5054. In fact, the amplitude is not what falls below spec first, but the triggering. at about 550MHz, the trigger starts becoming unstable. Nice!

As a side note, my scope has a number of errors from 2010 that I'd like to clear. I've looked through the operators, programming, and service manual and did not find anything on what command(s) might do this. Would you or anyone esle ahppen to know how to clear them?

Many thanks again! 👜 Jay

Did you do:

I tried with :PASSWord INTEKRITY first and that didn't make any difference. I updated the firmware to 2.40, no difference. Oops. - that was a typo (or perhaps wishful thinking! 😔 Yes, it reports itself as a MSO3054.

The error logs can be retrieved with: :ERRlog? :ERRlog:NEXt?

There's two other references in the firmware with regards to the error logs. :ERRlog:CLEar and :ERRlog:FILL The CLEar doesn't seem to work. FILL does not seem to do anything either.

Hi together,

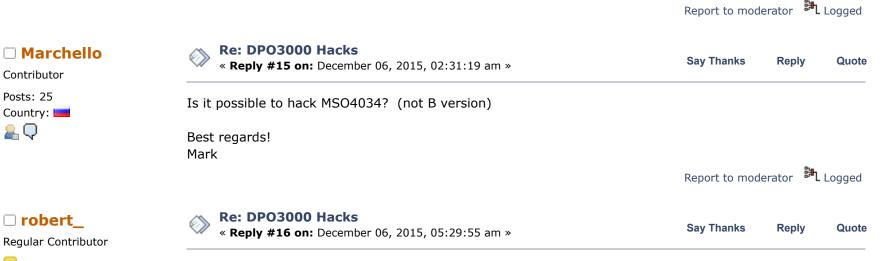

HWAccountant: ACQBandwidth 500

Posts: 134 💄 🖂 📿 indeed works fine, a 100Mhz model suddenly can trigger without problems on a 500Mhz signal, but... when displaying for example the frequency of that signal, it says low resolution (+- 2.5V P2P, and it's from a Rohde&Schwarz generator, quite clean 500Mhz sine wave), so I'm not too sure that hack alone does it... the "low resolution" warning starts at around 155Mhz, which suggests there's another soft-limit somewhere that needs to be 'extended'...

My scope (MSO3014) has a serial > C020000, so definitely one that does NOT need Tek for the upgrade...

The ideal way would be to find out how the key is generated for the 500Mhz upgrade, because the scope's firmware definitely knows what to do when upgrading...

Maybe some similar routines as for the MDO3000 ?? (if I got it right, the MDO3xxx option modules now contain not stupidly the option's name, but some encrypted form of it... so maybe the key generated by Tek for the DPO3K BW upgrade uses similar or identical routines...??)

Cant answer to this, but as i have a MSO3014, C02* at work, i did hack it some months ago. Worked fine, and bandwidth did improve, although it doesnt seem to meet the 3054 risetime spec. I measure around 1ns on a fast rise pulse, which measures around 600ns on a HDO6054 (samne on an old TDS7054), which would suggest around 350-400Mhz. Still a huge improvement over the standard 100Mhz, and enough to get my work done properly (where im dealing with around 3ns edges).

As for the options, i did install them the old way. Program one of these option modules (TDS3FFT borrowed from an old TDS3k, not needed anymore) with the option needed, insert in scope and transfer the licence from the module to the scope, reprogram with next option and repeat.

@Marchello...

Don't think so... DPO4K's are not bandwidth upgradeable, and other Tek models have shown to have high-pass filters in hardware to differentiate models (same board, but a few different components...), so a bandwidth upgrade is possible in theory (up to 500Mhz for the 2.5GS/s models), but definitely requires hardware changes, and to my knowledge, these have never been attempted, nor documented anywhere...

I did bandwidth-update my DPO5034 (they have 5GS/s even for the 350MHz models) by removing the lowpass (on one channel), see http://debugmo.de/2013/03/whats-inside-tektronix-dpo5034/ .

I also hacked my DPO4034 (non-B) to "more" bandwidth by hacking the executable - not a nice hack by any means. The DPO4034 has the pre-amp which the DPO4034B and DPO5034(B) lack; but it only has 2.5GHz so that limits the usefulness a bit.

Re: DPO3000 Hacks « Reply #25 on: January 22, 2016, 06:22:21 am »

It may sound a bit more difficult than it actually is...

The binaries typically contain a lot of debug stuff, that ease finding the functions of interest, then looking after some forms of "load" instructions preceding function calls (like Encrypt()...), you rapidly can find addresses of interest and find out the AES key, same approach for the option masks, there's usually one function for evaluating an option key, and that function references all the possible option masks at some point... not trivial, but with some reasonable assembler knowledge (32 bit x86 assembler for TDS500B I think ??), and some time, it should be feasible...

Regards

I don't think you can break something for good... the point is that there's to my knowledge no known way to 'uninstall' the upgrade (regardless if it was done with a key, or with system commands...), so if you did, and it makes your scope somehow unusable, you're good to send it in for servicing... "
