## Small 1A, Low-Dropout Linear Regulator in a 2.7mm x 1.6mm Package

#### **General Description**

The MAX15101 is a small, low-dropout linear regulator optimized for networking, datacom, and server applications. The regulator delivers up to 1A from a 1.7V to 5.5V input supply with output accuracy of  $\pm$ 1.6%. The output is adjustable down to 0.6V with a guaranteed dropout voltage of less than 100mV at full load. The internal p-channel switch is protected with a foldback current limit and thermal shutdown.

The MAX15101 features an external bypass input to reduce noise. This bypass input also serves as a soft-start control. An enable input and power-good output are included for power sequence control.

The MAX15101 is available in a 1.6mm x 2.7mm WLP package and is fully specified from the  $-40^{\circ}$ C to  $+85^{\circ}$ C operating temperature range.

#### **Applications**

- Networking
- Telecom/Datacom
- Servers
- Base Stations
- PLL Power

# • 1.7V to 5.5V Operating Range

- 100mV Dropout Guaranteed at 1A
- ±1.6% Output Accuracy Over Line, Load, and Temperature
- Adjustable Output from 0.6V to 5.2V
- Foldback Current Protection
- Thermal Shutdown Protection
- Low Noise 15µV<sub>RMS</sub> (typ)
- Small 1.6mm x 2.7mm WLP Package

Ordering Information appears at end of data sheet.

### **Absolute Maximum Ratings**

| IN, SS_BYP, FB to GND0.3V to +6V                      | Operating Temperature Range40°C to +85°C      |
|---|---|
| EN, PG, OUT to GND0.3V to (V <sub>IN</sub> + 0.3V)    | Storage Temperature Range65°C to +150°C       |
| OUT Short CircuitContinuous                           | Junction Temperature+150°C                    |
| Continuous Power Dissipation (T <sub>A</sub> = +70°C) | Soldering Temperature (reflow) (Note 1)+260°C |
| WLP (derate 19.2mW/°C above +70°C)1538mW              |   |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 1:** The WLP package is constructed using a unique set of package techniques that impose a limit on the thermal profile. The device can be exposed during board-level solder attach and rework. This limit permits only the use of the solder profiles recommended in the industry-standard specification JEDEC 020A, paragraph 7.6, Table 3 for IR/VPR and convection reflow. Preheating is required. Hand or wave soldering is not allowed.

### Package Thermal Characteristics (Note 2)

#### WLP

**Note 2:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

| A4                    | SS_BYP | SS_BYP Bypass/Soft-Start Input. Connect a ceramic capacitor from SS_BYP to GND to reduce the output noise and set the soft-start ramp time. |
| A5                    | FB     | Feedback Input. Connect a resistive divider from OUT to GND to set the output voltage.  |
| B1, B2, B3,<br>B4, B5 | IN     | Supply Voltage Input. Connect to supply voltage from 1.7V to 5.5V. Bypass IN to GND with a 2.2 $\mu$ F or greater ceramic capacitor.        |
| C1, C2, C3,<br>C4, C5 | OUT    | Regulated Output. Connect a 10µF capacitor from OUT to GND. For better load transient performance a larger capacitor can be used.           |

# Small 1A, Low-Dropout Linear Regulator in a 2.7mm x 1.6mm Package

### **Functional Diagram**

### **Detailed Description**

The MAX15101 is a small, low-dropout linear regulator optimized for server, network, and telecom applications. The regulator delivers up to 1A from a 1.7V to 5.5V input supply with output accuracy of  $\pm$ 1.6%. The output is adjustable down to 0.6V with a guaranteed dropout voltage of less than 100mV at full load. The internal p-channel switch is protected with a foldback current limit and thermal shutdown.

The MAX15101 features an external bypass input to reduce noise. This bypass input also serves as a soft-start control. An enable input and power-good output are included for power sequence control.

#### Internal p-Channel Pass Transistor

The MAX15101 features a 1A p-channel MOSFET pass transistor. Unlike similar designs with pnp pass transistors, the gate-drive current to the p-channel power transistor is extremely low. PNP-based regulators also waste

considerable current in dropout when the pass transistor saturates and uses high base-drive currents under large loads. The MAX15101 does not suffer from these deficiencies and consumes only 1.8mA of quiescent current even in dropout.

#### **Output Voltage Selection**

The MAX15101 features an adjustable output. The output voltage can be set between +0.6V to  $V_{IN}$  - 200mV using an external resistive voltage-divider to FB (see the <u>Typical</u> <u>Operating Characteristics</u>). The output voltage is set using the following equation:

$$V_{OUT} = V_{FB} (1 + R1/R2)$$

where  $V_{FB}$  = +600mV.

To simplify resistor selection:

$$R1 = R2 (V_{OUT}/V_{FB} - 1)$$

Set R2 to  $600\Omega$ .

# Small 1A, Low-Dropout Linear Regulator in a 2.7mm x 1.6mm Package

#### Enable

A logic-low on EN disables the MAX15101. In shutdown, the pass transistor, control circuitry, reference, and all biases are turned off, reducing supply current to typically 1 $\mu$ A. Connect EN to IN for normal operation. In shutdown, the soft-start capacitor is discharged using an internal pulldown resistance.

#### Soft-Start

As shown in the <u>Typical Operating Characteristics</u>, the MAX15101 uses a  $g_M$  stage and integrating capacitor  $C_{SS}$  to control the regulator's feedback set point. When EN is driven low, the soft-start capacitor is discharged. When EN is driven high or power is applied to the device, a constant 9.2µA current charges the soft-start capacitor. At startup, the feedback set point increases linearly, which reduces the inrush supply current.

 $t_{SS} = 6.315 \times 10^{-5} \times C_{SS}$ 

where  $C_{SS}$  is in nF. Use capacitor values between 30nF to 100nF with voltage ratings greater than 5V.

Because this ramp is applied to the current-limit comparator, the actual time for the output voltage to ramp up depends on the load current and output capacitor. Leave SS\_BYP unconnected to disable soft-start.

#### **Foldback Current Limiting**

The MAX15101 features a 1.6A current limit when the output voltage is in regulation. When the voltage at the output drops to 17% of its nominal value, the current limit exponentially folds back to 1A. The output can be shorted to ground for an indefinite period of time without damag ing the device. Avoid continuous output current of greater than 1A to prevent damage to the regulator.

#### **Thermal-Overload Protection**

A thermal-overload circuit limits total power dissipation in the MAX15101. When the junction temperature exceeds  $T_J = +160^{\circ}$ C, the thermal sensor turns off the pass transistor, allowing the IC to cool. The thermal sensor turns the pass transistor on once the IC's junction temperature drops approximately 15°C. Continuous short-circuit conditions will consequently result in a foldback limited output.

Thermal-overload protection is designed to safeguard the MAX15101 in the event of fault conditions. For continuous operation, do not exceed the junction temperature rating of  $T_J$  = +125°C.

#### **Operating Region and Power Dissipation**

The power dissipation across the device is P =  $I_{OUT}$  (V<sub>IN</sub> - V<sub>OUT</sub>). The resulting maximum power dissipation is:

#### $\mathsf{P}_{\mathsf{MAX}} = [(\mathsf{T}_{\mathsf{J}(\mathsf{MAX})} - \mathsf{T}_{\mathsf{A}})/(\theta_{\mathsf{JA}})]$

where  $(T_{J(MAX)} - T_A)$  is the temperature difference between the maximum allowed die junction (+150°C) and the surrounding air. Figure 1 shows the allowable power dissipation for typical PCBs at +25°C, +50°C, and +70°C ambient temperatures (refer to the MAX15101 EV kit).

#### **Applications Information**

#### **Capacitor Selection and Regulator Stability**

Capacitors are required at the MAX15101's input and output. Connect at least a  $2.2\mu F$  capacitor between IN and GND (C<sub>IN</sub>) and a  $10\mu F$  capacitor between OUT and GND (C<sub>OUT</sub>). Use only surface-mount ceramic capacitors that have low equivalent series resistance (ESR). Make the input and output traces at least 2.5mm wide, and connect C<sub>IN</sub> and C<sub>OUT</sub> within 6mm of the IC to minimize the impact of PCB trace inductance.

The output capacitor's ESR can affect stability and output noise. Use capacitors with  $50m\Omega$  or less ESR to ensure stability and optimum transient response. This is particularly true in applications with very low output voltage (< 2V) and high output current (> 0.5A).

Since some capacitor dielectrics can vary over bias voltage and temperature, consult the capacitor manufacturer specifications to ensure that the capacitors meet these requirements over all combinations of operating voltage and temperature.

Figure 1. Maximum Output Current Curves

# Small 1A, Low-Dropout Linear Regulator in a 2.7mm x 1.6mm Package

#### Input-Output (Dropout) Voltage

A regulator's minimum input-to-output voltage differential (dropout voltage) determines the lowest usable supply voltage. The dropout voltage is simply the product of regulator's  $R_{DS(ON)}$  for the pass device and rated load current. The MAX15101's  $R_{DS(ON)}$  is  $20m\Omega$ , at 1A this yields a dropout voltage of 20mV (see the <u>Electrical</u> <u>Characteristics</u> and the Dropout Voltage vs. Output Current graph in the <u>Typical Operating Characteristics</u>).

#### Noise, PSRR, and Transient Response

The MAX15101 is designed to achieve low dropout voltage while still maintaining good noise, transient response, and AC rejection. When operating from very noisy sources, supply noise rejection and transient response can be improved by increasing the values of the input and output capacitors. The MAX15101 output noise is typically  $15\mu V_{RMS}$  (see the Noise Density graph in the <u>Typical</u> Operating Characteristics).

# Thermal Considerations in PCB Layout

The rated package dissipation strongly depends on the copper area connected to the regulator. The maximum power dissipation allowed in the package is 1538mW (measured from the MAX15101 EV kit).

More power dissipation can be handled by the package if great attention is given during PCB layout. For example, using the top and bottom copper as a heatsink and connecting the thermal vias to one of the middle layers (GND) transfers the heat from the package into the board more efficiently, resulting in lower junction temperature at high power dissipation in some MAX15101 applications. Furthermore, the solder mask around the IC area on both top and bottom layers can be removed to radiate the heat directly into the air. The maximum allowable power dissipation in the IC is as follows:

#### $P_{MAX} = [(T_{J(MAX)} - T_A)/(\theta_{JA})]$

where  $(T_{J(MAX)} - T_A)$  is the temperature difference between the maximum-allowed die junction (+150°C) and the surrounding air.

A sample layout is available on the MAX15101 EV kit.

### **Ordering Information**

| PART                               | TEMP RANGE | PIN-PACKAGE |  |  |
|------------------------------------|------------|-------------|--|--|
| MAX15101EWL+ -40°C to +85°C 15 WLP |            |             |  |  |
|                                    |            |             |  |  |

+Denotes a lead(Pb)-free/RoHS-compliant package.

#### **Chip Information**

PROCESS: BICMOS

#### **Package Information**

For the latest package outline information and land patterns (footprints), go to <u>www.maximintegrated.com/packages</u>. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

| PACKAGE | PACKAGE  | OUTLINE        | LAND                                 |
|---------|----------|----------------|--------------------------------------|
| TYPE    | CODE     | NO.            | PATTERN NO.                          |
