

MC68HC16Z1

Technical Supplement

25.17 MHz Electrical Characteristics

Devices in the M68HC16 Modular Microcontroller Family are built up from a selection of standard functional modules. Published electrical characteristics for MC68HC16Z1 devices are based on a 16.78 MHz system clock. New products that operate at clock frequencies of 25.17 MHz are now available. This supplement consists of a new electrical characteristics appendix (Appendix A) that supplements those published in the *MC68HC16Z1 User's Manual* (MC68HC16Z1UM/AD).

The supplement contains the following updated specifications:

Table	Page
Maximum Ratings	2
Typical Ratings	3
Thermal Characteristics	3
Clock Control Timing	4
DC Characteristics	5
AC Timing	7
Background Debugging Mode Timing	18
ECLK Bus Timing	19
QSPI Timing	20
ADC Maximum Ratings	23
ADC DC Electrical Characteristics (Operating)	24
ADC AC Characteristics (Operating)	24
ADC Conversion Characteristics (Operating)	25

Table A–1 Maximum Ratings

Num	Rating	Symbol	Value	Unit
1	Supply Voltage ^{1, 2, 3}	V_{DD}	- 0.3 to + 6.5	V
2	Input Voltage ^{1, 2, 3, 4, 5, 7}	V_{IN}	- 0.3 to + 6.5	V
3	Instantaneous Maximum Current Single Pin Limit (all pins) ^{1, 3, 5, 6}	I_D	25	mA
4	Operating Maximum Current Digital Input Disruptive Current ^{3, 5, 6, 7, 8} $V_{NEGCLAMP} \cong -0.3\text{ V}$ $V_{POSCLAMP} \cong V_{DD} + 0.3$	I_{ID}	- 500 to 500	μA
5	Operating Temperature Range “C” Suffix “V” Suffix “M” Suffix	T_A	TL to TH - 40 to 85 - 40 to 105 - 40 to 125	$^{\circ}\text{C}$
6	Storage Temperature Range	T_{stg}	- 55 to 150	$^{\circ}\text{C}$

NOTES:

1. Permanent damage can occur if maximum ratings are exceeded. Exposure to voltages or currents in excess of recommended values affects device reliability. Device modules may not operate normally while being exposed to electrical extremes.
2. Although sections of the device contain circuitry to protect against damage from high static voltages or electrical fields, take normal precautions to avoid exposure to voltages higher than maximum-rated voltages.
3. This parameter is periodically sampled rather than 100% tested.
4. All pins except TSC.
5. Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.
6. Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current.
7. All functional non-supply pins are internally clamped to V_{SS} . All functional pins except EXTAL and XFC are internally clamped to V_{DD} .
8. Total input current for all digital input-only and all digital input/output pins must not exceed 10 mA. Exceeding this limit can cause disruption of normal operation.

Table A–2 Typical Ratings

Num	Rating	Symbol	Value	Unit
1	Supply Voltage	V _{DD}	5.0	V
2	Operating Temperature	T _A	25	°C
3	V _{DD} Supply Current RUN LPSTOP, VCO off LPSTOP, External clock, max f _{sys}	I _{DD}	113 125 3.75	mA μA mA
4	Clock Synthesizer Operating Voltage	V _{DDSYN}	5.0	V
5	V _{DDSYN} Supply Current VCO on, maximum f _{sys} External Clock, maximum f _{sys} LPSTOP, VCO off V _{DD} powered down	I _{DDSYN}	1.0 5.0 100 50	mA mA μA μA
6	RAM Standby Voltage	V _{SB}	3.0	V
7	RAM Standby Current Normal RAM operation Standby operation	I _{SB}	7.0 40	μA μA
8	Power Dissipation	P _D	570	mW

Table A–3 Thermal Characteristics

Num	Characteristic	Symbol	Value	Unit
1	Thermal Resistance ¹ Plastic 132-Pin Surface Mount Plastic 144-Pin Surface Mount	Θ _{JA}	38 49	°C/W

NOTES:

1. The average chip-junction temperature (T_J) in C can be obtained from (1):

$$T_J = T_A + (P_D \cdot \Theta_{JA})$$

where:

T_A= Ambient Temperature, °C

Θ_{JA}= Package Thermal Resistance, Junction-to-Ambient, °C/W

P_D= P_{INT} + P_{I/O}

P_{INT}= I_{DD} × V_{DD}, Watts — Chip Internal Power

P_{I/O}= Power Dissipation on Input and Output Pins — User Determined

For most applications P_{I/O} < P_{INT} and can be neglected. An approximate relationship between P_D and T_J (if P_{I/O} is neglected) is (2):

$$P_D = K + (T_J + 273^\circ\text{C})$$

Solving equations (1) and (2) for K gives (3):

$$K = P_D + (T_A + 273^\circ\text{C}) + \Theta_{JA} \times P_{D^2}$$

Where K is a constant pertaining to the particular part. K can be determined from equation (3) by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving equations (1) and (2) iteratively for any value of T_A.

Table A-4 Clock Control Timing
 $(V_{DD}$ and $V_{DDSYN} = 5.0 \text{ Vdc} \pm 5\%$, $V_{SS} = 0 \text{ Vdc}$, $T_A = T_L$ to T_H , Stable External Reference)¹

Num	Characteristic	Symbol	Minimum	Maximum	Unit
1	PLL Reference Frequency Range	f_{ref}	25	50	kHz
2	System Frequency ² On-Chip PLL System Frequency External Clock Operation	f_{sys}	dc 0.131 dc	25.17 25.17 25.17	MHz
3	PLL Lock Time ^{3,5,6,7}	t_{pll}	—	20	ms
4	VCO Frequency ⁴	f_{VCO}	—	2 (f_{sys} max)	MHz
5	Limp Mode Clock Frequency SYNCR X bit = 0 SYNCR X bit = 1	f_{limp}	— —	f_{sys} max / 2 f_{sys} max	MHz
6	CLKOUT Jitter ^{5,6,7,8} Short term (5 μ s interval) Long term (500 μ s interval)	J_{clk}	-1.0 -0.5	1.0 0.5	%

NOTES:

1. Tested with a 32.768 kHz reference.
2. All internal registers retain data at 0 Hz.
3. Assumes that stable V_{DDSYN} is applied, and that the crystal oscillator is stable. Lock time is measured from the time V_{DD} and V_{DDSYN} are valid until \overline{RESET} is released. This specification also applies to the period required for PLL lock after changing the W and Y frequency control bits in the synthesizer control register (SYNCR) while the PLL is running, and to the period required for the clock to lock after LPSTOP.
4. Internal VCO frequency (f_{VCO}) is determined by SYNCR W and Y bit values.
The SYNCR X bit controls a divide-by-two circuit that is not in the synthesizer feedback loop.
When X = 0, the divider is enabled, and $f_{sys} = f_{VCO} \div 4$.
When X = 1, the divider is disabled, and $f_{sys} = f_{VCO} \div 2$.
X must equal one when operating at maximum specified f_{sys} .
5. This parameter is periodically sampled rather than 100% tested.
6. Assumes that a low-leakage external filter network is used to condition clock synthesizer input voltage. Total external resistance from the XFC pin due to external leakage must be greater than 15 M Ω to guarantee this specification. Filter network geometry can vary depending upon operating environment.
7. Proper layout procedures must be followed to achieve specifications.
8. Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{sys} . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the PLL circuitry via V_{DDSYN} and V_{SS} and variation in crystal oscillator frequency increase the J_{clk} percentage for a given interval. When jitter is a critical constraint on control system operation, this parameter should be measured during functional testing of the final system.

Table A–5 DC Characteristics
 $(V_{DD} \text{ and } V_{DDSYN} = 5.0 \text{ Vdc} \pm 5\%, V_{SS} = 0 \text{ Vdc}, T_A = T_L \text{ to } T_H)$

Num	Characteristic	Symbol	Min	Max	Unit
1	Input High Voltage	V_{IH}	0.7 (V_{DD})	$V_{DD} + 0.3$	V
2	Input Low Voltage	V_{IL}	$V_{SS} - 0.3$	0.2 (V_{DD})	V
3	Input Hysteresis ^{1, 2}	V_{HYS}	0.5	—	V

Table A-5 DC Characteristics (Continued)

(V_{DD} and $V_{DDSYN} = 5.0 \text{ Vdc} \pm 5\%$, $V_{SS} = 0 \text{ Vdc}$, $T_A = T_L$ to T_H)

Num	Characteristic	Symbol	Min	Max	Unit
19	Load Capacitance ¹⁶	C_L	—	90	pF
	Group 1 I/O Pins, CLKOUT, FREEZE/QUOT, IPIPE0				
	Group 2 I/O Pins and CSBOOT, BG/CS				
	Group 3 I/O Pins				
	Group 4 I/O Pins			200	

NOTES:

1. Applies to:
 - Port ADA[7:0] — AN[7:0]
 - Port E[7:4] — SIZ[1:0], \overline{AS} , \overline{DS}
 - Port F[7:0] — IRQ[7:1], MODCLK
 - Port GP[7:0] — IC4/OC5/OC1, IC[3:1], OC[4:1]/OC1
 - Port QS[7:0] — TXD, PCS[3:1], PCS0/ \overline{SS} , SCK, MOSI, MISO
 - \overline{BKPT} /DSCLK, DSI/IPIPE1, PAI, PCLK, \overline{RESET} , RXD, TSC
 - EXTAL (when PLL enabled)
2. This parameter is periodically sampled rather than 100% tested.
3. Applies to all input-only pins except ADC pins.
4. Applies to all input/output and output pins
5. Does not apply to \overline{HALT} and \overline{RESET} because they are open drain pins. Does not apply to Port QS[7:0] (TXD, PCS[3:1], PCS0/ \overline{SS} , SCK, MOSI, MISO) in wired-OR mode.
6. Applies to Group 1, 2, 4 input/output and all output pins
7. Applies to Group 1, 2, 3, 4 input/output pins, $\overline{BG/CS}$, CLKOUT, \overline{CSBOOT} , FREEZE/QUOT, and IPIPE0
8. Applies to DATA[15:0]
9. Use of an active pulldown device is recommended.
10. Total operating current is the sum of the appropriate I_{DD} , I_{DDSYN} , and I_{SB} values, plus I_{DDA} . I_{DD} values include supply currents for device modules powered by V_{DDE} and V_{DDI} pins.
11. Current measured at maximum system clock frequency, all modules active.
12. Tested with a 32.768 kHz crystal reference.
13. The SRAM module will not switch into standby mode as long as V_{SB} does not exceed V_{DD} by more than 0.5 volts. The SRAM array cannot be accessed while the module is in standby mode.
14. When V_{SB} is more than 0.3 V greater than V_{DD} , current flows between the V_{STBY} and V_{DD} pins, which causes standby current to increase toward the maximum transient condition specification. System noise on the V_{DD} and V_{STBY} pin can contribute to this condition.
15. Power dissipation measured at specified system clock frequency, all modules active. Power dissipation can be calculated using the expression:

$$P_D = \text{Maximum } V_{DD} (I_{DD} + I_{DDSYN} + I_{SB}) + \text{Maximum } V_{DDA} (I_{DDA})$$
 I_{DD} includes supply currents for all device modules powered by V_{DDE} and V_{DDI} pins.
16. Input-Only Pins: EXTAL, TSC, \overline{BKPT} /DSCLK, PAI, PCLK, RXD
 Output-Only Pins: \overline{CSBOOT} , $\overline{BG/CS1}$, CLKOUT, FREEZE/QUOT, DS0/IPIPE0, PWMA, PWMB
 Input/Output Pins:
 - Group 1: Port GP[7:0] — IC4/OC5/OC1, IC[3:1], OC[4:1]/OC1
DATA[15:0], DSI/IPIPE1
 - Group 2: Port C[6:0] — ADDR[22:19]/ \overline{CS} [9:6], FC[2:0]/ \overline{CS} [5:3]
Port E[7:0] — SIZ[1:0], \overline{AS} , \overline{DS} , \overline{AVEC} , \overline{DSACK} [1:0]
Port F[7:0] — IRQ[7:1], MODCLK
Port QS[7:3] — TXD, PCS[3:1], PCS0/ \overline{SS} , ADDR23/ \overline{CS} 10/ \overline{ECLK}
ADDR[18:0], R/ \overline{W} , \overline{BERR} , $\overline{BR/CS0}$, $\overline{BGACK/CS2}$
 - Group 3: \overline{HALT} , \overline{RESET}
 - Group 4: MISO, MOSI, SCK

NOTES:

- All AC timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels unless otherwise noted.
- Minimum system clock frequency is four times the crystal frequency, subject to specified limits.
- When an external clock is used, minimum high and low times are based on a 50% duty cycle. The minimum allowable t_{XCYC} period is reduced when the duty cycle of the external clock varies. The relationship between external clock input duty cycle and minimum t_{XCYC} is expressed:
Minimum t_{XCYC} period = minimum t_{XCHL} / (50% – external clock input duty cycle tolerance).
- Parameters for an external clock signal applied while the internal PLL is disabled (MODCLK pin held low during reset). Does not pertain to an external VCO reference applied while the PLL is enabled (MODCLK pin held high during reset). When the PLL is enabled, the clock synthesizer detects successive transitions of the reference signal. If transitions occur within the correct clock period, rise/fall times and duty cycle are not critical.
- Specification 9A is the worst-case skew between \overline{AS} and \overline{DS} or \overline{CS} . The amount of skew depends on the relative loading of these signals. When loads are kept within specified limits, skew will not cause \overline{AS} and \overline{DS} to fall outside the limits shown in specification 9.
- If multiple chip selects are used, \overline{CS} width negated (specification 15) applies to the time from the negation of a heavily loaded chip select to the assertion of a lightly loaded chip select. The \overline{CS} width negated specification between multiple chip selects does not apply to chip selects being used for synchronous ECLK cycles.
- Hold times are specified with respect to \overline{DS} or \overline{CS} on asynchronous reads and with respect to CLKOUT on fast cycle reads. The user is free to use either hold time.
- Maximum value is equal to $(t_{CYC} / 2) + 25$ ns.
- If the asynchronous setup time (specification 47A) requirements are satisfied, the $\overline{DSACK}[1:0]$ low to data setup time (specification 31) and $\overline{DSACK}[1:0]$ low to \overline{BERR} low setup time (specification 48) can be ignored. The data must only satisfy the data-in to clock low setup time (specification 27) for the following clock cycle. \overline{BERR} must satisfy only the late \overline{BERR} low to clock low setup time (specification 27A) for the following clock cycle.
- To ensure coherency during every operand transfer, \overline{BG} is not asserted in response to \overline{BR} until after all cycles of the current operand transfer are complete.
- In the absence of $\overline{DSACK}[1:0]$, \overline{BERR} is an asynchronous input using the asynchronous setup time (specification 47A).
- After external \overline{RESET} negation is detected, a short transition period (approximately 2 t_{CYC}) elapses, then the SIM drives \overline{RESET} low for 512 t_{CYC} .
- External assertion of the \overline{RESET} input can overlap internally-generated resets. To insure that an external reset is recognized in all cases, \overline{RESET} must be asserted for at least 590 CLKOUT cycles.
- External logic must pull \overline{RESET} high during this period in order for normal MCU operation to begin.
- Eight pipeline states are multiplexed into IPIPE[1:0]. The multiplexed signals have two phases.
- Address access time = $(2.5 + WS) t_{CYC} - t_{CHAV} - t_{DICL}$
Chip select access time = $(2 + WS) t_{CYC} - t_{CLSA} - t_{DICL}$
Where: WS = number of wait states. When fast termination is used (2 clock bus) WS = -1.

Table A–10 ADC Maximum Ratings

Num	Parameter	Symbol	Min	Max	Unit
1	Analog Supply	V_{DDA}	-0.3	6.5	V
2	Internal Digital Supply, with reference to V_{SS1}	V_{DDI}	-0.3	6.5	V
3	Reference Supply, with reference to V_{SS1}	V_{RH}, V_{RL}	-0.3	6.5	V
4	V_{SS} Differential Voltage	$V_{SS1} - V_{SSA}$	-0.1	0.1	V
5	V_{DD} Differential Voltage	$V_{DDI} - V_{DDA}$	-6.5	6.5	V
6	V_{REF} Differential Voltage	$V_{RH} - V_{RL}$	-6.5	6.5	V
7	V_{RH} to V_{DDA} Differential Voltage	$V_{RH} - V_{DDA}$	-6.5	6.5	V
8	V_{RL} to V_{SSA} Differential Voltage	$V_{RL} - V_{SSA}$	-6.5	6.5	V
9	Disruptive Input Current ^{1,2,3,4,5,6,7} $V_{NEGCLAMP} \equiv -0.3$ V $V_{POSCLAMP} \equiv 8$ V	I_{NA}	-500	500	μ A
10	Positive Overvoltage Current Coupling Ratio ^{1,5,6,8}	K_P	2000	—	—
11	Negative Overvoltage Current Coupling Ratio ^{1,5,6,8}	K_N	500	—	—
12	Maximum Input Current ^{3,4,6} $V_{NEGCLAMP} \equiv -0.3$ V $V_{POSCLAMP} \equiv 8$ V	I_{MA}	-25	25	mA

NOTES:

1. Below disruptive current conditions, a stressed channel will store the maximum conversion value for analog inputs greater than V_{RH} and the minimum conversion value for inputs less than V_{RL} . This assumes that $V_{RH} \leq V_{DDA}$ and $V_{RL} \geq V_{SSA}$ due to the presence of the sample amplifier. Other channels are not affected by non-disruptive conditions.
2. Input signals with large slew rates or high frequency noise components cannot be converted accurately. These signals also interfere with conversion of other channels.
3. Exceeding limit may cause conversion error on stressed channels and on unstressed channels. Transitions within the limit do not affect device reliability or cause permanent damage.
4. Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values using positive and negative clamp values, then use the larger of the calculated values.
5. This parameter is periodically sampled rather than 100% tested.
6. Applies to single pin only.
7. The values of external system components can change the maximum input current value, and affect operation. A voltage drop may occur across the external source impedances of the adjacent pins, impacting conversions on these adjacent pins. The actual maximum may need to be determined by testing the complete design.
8. Current coupling is the ratio of the current induced from overvoltage (positive or negative, through an external series coupling resistor), divided by the current induced on adjacent pins. A voltage drop may occur across the external source impedances of the adjacent pins, impacting conversions on these adjacent pins.

Table A–11 ADC DC Electrical Characteristics (Operating)
 $(V_{SS} = 0 \text{ Vdc}, \text{ADCLK} = 2.1 \text{ MHz}, T_A = T_L \text{ to } T_H)$

Num	Parameter	Symbol	Min	Max	Unit
1	Analog Supply ¹	V_{DDA}	4.5	5.5	V
2	Internal Digital Supply ¹	V_{DDI}	4.5	5.5	V
3	V_{SS} Differential Voltage	$V_{SSI} - V_{SSA}$	-1.0	1.0	mV
4	V_{DD} Differential Voltage	$V_{DDI} - V_{DDA}$	-1.0	1.0	V
5	Reference Voltage Low ^{2, 3}	V_{RL}	V_{SSA}	$V_{DDA} / 2$	V
6	Reference Voltage High ^{2, 3}	V_{RH}	$V_{DDA} / 2$	V_{DDA}	V
7	V_{REF} Differential Voltage ³	$V_{RH} - V_{RL}$	4.5	5.5	V
8	Input Voltage ²	V_{INDC}	V_{SSA}	V_{DDA}	V
9	Input High, Port ADA	V_{IH}	$0.7 (V_{DDA})$	$V_{DDA} + 0.3$	V
10	Input Low, Port ADA	V_{IL}	$V_{SSA} - 0.3$	$0.2 (V_{DDA})$	V
11	Analog Supply Current	I_{DDA}	—	1.0	mA
	Normal Operation ⁴				
	Low-power stop			200	μA
12	Reference Supply Current	I_{REF}	—	250	μA
13	Input Current, Off Channel ⁵	I_{OFF}	—	150	nA
14	Total Input Capacitance, Not Sampling	C_{INN}	—	10	pF
15	Total Input Capacitance, Sampling	C_{INS}	—	15	pF

NOTES:

- Refers to operation over full temperature and frequency range.
- To obtain full-scale, full-range results, $V_{SSA} \leq V_{RL} \leq V_{INDC} \leq V_{RH} \leq V_{DDA}$.
- Accuracy tested and guaranteed at $V_{RH} - V_{RL} = 5.0 \text{ V} \pm 5\%$.
- Current measured at maximum system clock frequency with ADC active.
- Maximum leakage occurs at maximum operating temperature. Current decreases by approximately one-half for each 10°C decrease from maximum temperature.

Table A–12 ADC AC Characteristics (Operating)
 $(V_{DD}$ and $V_{DDA} = 5.0 \text{ Vdc} \pm 5\%$, $V_{SS} = 0 \text{ Vdc}$, T_A within operating temperature range)

Num	Parameter	Symbol	Min	Max	Unit
1	ADC Clock Frequency	f_{adclk}	0.5	2.1	MHz
2	8-bit Conversion Time ¹ $F_{ADCLK} = 1.0 \text{ MHz}$ $F_{ADCLK} = 2.1 \text{ MHz}$	t_{conv}	15.2	—	μs
			7.6		
3	10-bit Conversion Time ¹ $F_{ADCLK} = 1.0 \text{ MHz}$ $F_{ADCLK} = 2.1 \text{ MHz}$	t_{conv}	17.1	—	μs
			8.6		
4	Stop Recovery Time	t_{sr}	—	10	μs

NOTES:

- Conversion accuracy varies with f_{adclk} rate. Reduced conversion accuracy occurs at maximum.

Table A–13 ADC Conversion Characteristics (Operating)

(V_{DD} and $V_{DDA} = 5.0 \text{ Vdc} \pm 5\%$, $V_{SS} = 0 \text{ Vdc}$, $T_A = T_L$ to T_H ,
 $0.5 \text{ MHz} \leq f_{\text{adclk}} \leq 1.0 \text{ MHz}$, 2 clock input sample time)

Num	Parameter	Symbol	Min	Typ	Max	Unit
1	8-bit Resolution ¹	1 Count	—	20	—	mV
2	8-bit Differential Nonlinearity	DNL	–0.5	—	0.5	Counts
3	8-bit Integral Nonlinearity	INL	–1	—	1	Counts
4	8-bit Absolute Error ²	AE	–1	—	1	Counts
5	10-bit Resolution ¹	1 Count	—	5	—	mV
6	10-bit Differential Nonlinearity ³	DNL	–0.5	—	0.5	Counts
7	10-bit Integral Nonlinearity ³	INL	–2.0	—	2.0	Counts
8	10-bit Absolute Error ^{3, 4}	AE	–2.5	—	2.5	Counts
9	Source Impedance at Input ⁵	R_S	—	20	—	k Ω

NOTES:

- At $V_{RH} - V_{RL} = 5.12 \text{ V}$, one 10-bit count = 5 mV and one 8-bit count = 20 mV.
- 8-bit absolute error of 1 count (20 mV) includes 1/2 count (10 mV) inherent quantization error and 1/2 count (10 mV) circuit (differential, integral, and offset) error.
- Conversion accuracy varies with f_{adclk} rate. Reduced conversion accuracy occurs at maximum $F_{\text{AD-CLK}}$. Assumes that minimum sample time (2 ADC Clocks) is selected.
- 10-bit absolute error of 2.5 counts (12.5 mV) includes 1/2 count (2.5 mV) inherent quantization error and 2 counts (10 mV) circuit (differential, integral, and offset) error.
- Maximum source impedance is application-dependent. Error resulting from pin leakage depends on junction leakage into the pin and on leakage due to charge-sharing with internal capacitance. Error from junction leakage is a function of external source impedance and input leakage current. In the following expression, expected error in result value due to junction leakage (V_{errj}) is expressed:

$$V_{\text{errj}} = R_S \times I_{\text{OFF}}$$

where I_{OFF} is a function of operating temperature, as shown in table A-11.

Charge-sharing leakage is a function of input source impedance, conversion rate, change in voltage between successive conversions, and the size of the decoupling capacitor used. Error levels are best determined empirically. In general, continuous conversion of the same channel may not be compatible with high source impedance.
